## Cryptographic Engineering

## Elliptic-curve arithmetic

Radboud University, Nijmegen, The Netherlands

Spring 2021

## Diffie-Hellman

- Let $G$ be a cyclic, finite, abelian Group (written additively) and let $P$ be a generator of $G$

## Diffie-Hellman

- Let $G$ be a cyclic, finite, abelian Group (written additively) and let $P$ be a generator of $G$
- Alice chooses random $a \in\{0, \ldots,|G|-1\}$, computes $a P$, sends to Bob
- Bob chooses random $b \in\{0, \ldots,|G|-1\}$, computes $b P$, sends to Alice

## Diffie-Hellman

- Let $G$ be a cyclic, finite, abelian Group (written additively) and let $P$ be a generator of $G$
- Alice chooses random $a \in\{0, \ldots,|G|-1\}$, computes $a P$, sends to Bob
- Bob chooses random $b \in\{0, \ldots,|G|-1\}$, computes $b P$, sends to Alice
- Alice computes joint key $a(b P)$
- Bob computes joint key $b(a P)$

## Diffie-Hellman

- Let $G$ be a cyclic, finite, abelian Group (written additively) and let $P$ be a generator of $G$
- Alice chooses random $a \in\{0, \ldots,|G|-1\}$, computes $a P$, sends to Bob
- Bob chooses random $b \in\{0, \ldots,|G|-1\}$, computes $b P$, sends to Alice
- Alice computes joint key $a(b P)$
- Bob computes joint key $b(a P)$
- DLP in $G$ : given $k P \in G$ and $P$, find $k$
- Solving the DLP breaks security of Diffie-Hellman

## Diffie-Hellman

- Let $G$ be a cyclic, finite, abelian Group (written additively) and let $P$ be a generator of $G$
- Alice chooses random $a \in\{0, \ldots,|G|-1\}$, computes $a P$, sends to Bob
- Bob chooses random $b \in\{0, \ldots,|G|-1\}$, computes $b P$, sends to Alice
- Alice computes joint key $a(b P)$
- Bob computes joint key $b(a P)$
- DLP in $G$ : given $k P \in G$ and $P$, find $k$
- Solving the DLP breaks security of Diffie-Hellman

## Groups with hard DLP

- Traditional answer: $\mathbb{Z}_{p}^{*}$ with large prime-order subgroup

## Diffie-Hellman

- Let $G$ be a cyclic, finite, abelian Group (written additively) and let $P$ be a generator of $G$
- Alice chooses random $a \in\{0, \ldots,|G|-1\}$, computes $a P$, sends to Bob
- Bob chooses random $b \in\{0, \ldots,|G|-1\}$, computes $b P$, sends to Alice
- Alice computes joint key $a(b P)$
- Bob computes joint key $b(a P)$
- DLP in $G$ : given $k P \in G$ and $P$, find $k$
- Solving the DLP breaks security of Diffie-Hellman

## Groups with hard DLP

- Traditional answer: $\mathbb{Z}_{p}^{*}$ with large prime-order subgroup
- Modern answer: Elliptic curve over $\mathbb{F}_{q}$ with large prime-order subgroup

## Diffie-Hellman

- Let $G$ be a cyclic, finite, abelian Group (written additively) and let $P$ be a generator of $G$
- Alice chooses random $a \in\{0, \ldots,|G|-1\}$, computes $a P$, sends to Bob
- Bob chooses random $b \in\{0, \ldots,|G|-1\}$, computes $b P$, sends to Alice
- Alice computes joint key $a(b P)$
- Bob computes joint key $b(a P)$
- DLP in $G$ : given $k P \in G$ and $P$, find $k$
- Solving the DLP breaks security of Diffie-Hellman

## Groups with hard DLP

- Traditional answer: $\mathbb{Z}_{p}^{*}$ with large prime-order subgroup
- Modern answer: Elliptic curve over $\mathbb{F}_{q}$ with large prime-order subgroup
- Sophisticated answer (not in this lecture): hyperelliptic curves of genus 2

## Diffie-Hellman

- Let $G$ be a cyclic, finite, abelian Group (written additively) and let $P$ be a generator of $G$
- Alice chooses random $a \in\{0, \ldots,|G|-1\}$, computes $a P$, sends to Bob
- Bob chooses random $b \in\{0, \ldots,|G|-1\}$, computes $b P$, sends to Alice
- Alice computes joint key $a(b P)$
- Bob computes joint key $b(a P)$
- DLP in $G$ : given $k P \in G$ and $P$, find $k$
- Solving the DLP breaks security of Diffie-Hellman

## Groups with hard DLP

- Traditional answer: $\mathbb{Z}_{p}^{*}$ with large prime-order subgroup
- Modern answer: Elliptic curve over $\mathbb{F}_{q}$ with large prime-order subgroup
- Sophisticated answer (not in this lecture): hyperelliptic curves of genus 2

## Typical view on elliptic curves

## Definition

Let $K$ be a field and let $a_{1}, a_{2}, a_{3}, a_{4}, a_{6} \in K$. Then the following equation defines an elliptic curve $E$ :

$$
E: y^{2}+a_{1} x y+a_{3} y=x^{3}+a_{2} x^{2}+a_{4} x+a_{6}
$$

if the discriminant $\Delta$ of $E$ is not equal to zero. This equation is called the Weierstrass form of an elliptic curve.

## Typical view on elliptic curves

## Definition

Let $K$ be a field and let $a_{1}, a_{2}, a_{3}, a_{4}, a_{6} \in K$. Then the following equation defines an elliptic curve $E$ :

$$
E: y^{2}+a_{1} x y+a_{3} y=x^{3}+a_{2} x^{2}+a_{4} x+a_{6}
$$

if the discriminant $\Delta$ of $E$ is not equal to zero. This equation is called the Weierstrass form of an elliptic curve.

Characteristic $\neq 2,3$
If $\operatorname{char}(K) \neq 2,3$ we can use a simplified equation:

$$
E: y^{2}=x^{3}+a x+b
$$

## Typical view on elliptic curves

## Definition

Let $K$ be a field and let $a_{1}, a_{2}, a_{3}, a_{4}, a_{6} \in K$. Then the following equation defines an elliptic curve $E$ :

$$
E: y^{2}+a_{1} x y+a_{3} y=x^{3}+a_{2} x^{2}+a_{4} x+a_{6}
$$

if the discriminant $\Delta$ of $E$ is not equal to zero. This equation is called the Weierstrass form of an elliptic curve.

Characteristic $\neq 2,3$
If $\operatorname{char}(K) \neq 2,3$ we can use a simplified equation:

$$
E: y^{2}=x^{3}+a x+b
$$

## Characteristic 2

If $\operatorname{char}(K)=2$ we can (usually) use a simplified equation:

$$
E: y^{2}+x y=x^{3}+a x^{2}+b
$$

## Rational points

## Setup for cryptography

- Choose $K=\mathbb{F}_{q}$
- Consider the set of $\mathbb{F}_{q}$-rational points:

$$
E\left(\mathbb{F}_{q}\right)=\left\{(x, y) \in \mathbb{F}_{q} \times \mathbb{F}_{q}: y^{2}+a_{1} x y+a_{3} y=x^{3}+a_{2} x^{2}+a_{4} x+a_{6}\right\} \cup\{\mathcal{O}\}
$$

## Rational points

## Setup for cryptography

- Choose $K=\mathbb{F}_{q}$
- Consider the set of $\mathbb{F}_{q}$-rational points:

$$
E\left(\mathbb{F}_{q}\right)=\left\{(x, y) \in \mathbb{F}_{q} \times \mathbb{F}_{q}: y^{2}+a_{1} x y+a_{3} y=x^{3}+a_{2} x^{2}+a_{4} x+a_{6}\right\} \cup\{\mathcal{O}\}
$$

- The element $\mathcal{O}$ is the "point at infinity"

## Rational points

## Setup for cryptography

- Choose $K=\mathbb{F}_{q}$
- Consider the set of $\mathbb{F}_{q}$-rational points:

$$
E\left(\mathbb{F}_{q}\right)=\left\{(x, y) \in \mathbb{F}_{q} \times \mathbb{F}_{q}: y^{2}+a_{1} x y+a_{3} y=x^{3}+a_{2} x^{2}+a_{4} x+a_{6}\right\} \cup\{\mathcal{O}\}
$$

- The element $\mathcal{O}$ is the "point at infinity"
- This set forms a group (together with addition law)

## Rational points

## Setup for cryptography

- Choose $K=\mathbb{F}_{q}$
- Consider the set of $\mathbb{F}_{q}$-rational points:

$$
E\left(\mathbb{F}_{q}\right)=\left\{(x, y) \in \mathbb{F}_{q} \times \mathbb{F}_{q}: y^{2}+a_{1} x y+a_{3} y=x^{3}+a_{2} x^{2}+a_{4} x+a_{6}\right\} \cup\{\mathcal{O}\}
$$

- The element $\mathcal{O}$ is the "point at infinity"
- This set forms a group (together with addition law)
- Order of this group: $\left|E\left(\mathbb{F}_{q}\right)\right| \approx\left|\mathbb{F}_{q}\right|$

The group law
Example curve: $y^{2}=x^{3}-x$ over $\mathbb{R}$

The group law
Example curve: $y^{2}=x^{3}-x$ over $\mathbb{R}$

Addition of points

- Add points

$$
\begin{aligned}
& P=(-0,9 ;-0,4135) \text { and } \\
& Q=(-0,1 ; 0,3146)
\end{aligned}
$$

## Addition of points

- Add points

$$
\begin{aligned}
& P=(-0,9 ;-0,4135) \text { and } \\
& Q=(-0,1 ; 0,3146)
\end{aligned}
$$

- Compute line through the two points

## Addition of points

- Add points

$$
\begin{aligned}
& P=(-0,9 ;-0,4135) \text { and } \\
& Q=(-0,1 ; 0,3146)
\end{aligned}
$$

- Compute line through the two points
- Determine third intersection $T=\left(x_{T}, y_{T}\right)$ with the elliptic curve

## Addition of points

- Add points

$$
\begin{aligned}
& P=(-0,9 ;-0,4135) \text { and } \\
& Q=(-0,1 ; 0,3146)
\end{aligned}
$$

- Compute line through the two points
- Determine third intersection $T=\left(x_{T}, y_{T}\right)$ with the elliptic curve
- Result of the addition:

$$
P+Q=\left(x_{T},-y_{T}\right)
$$

The group law
Example curve: $y^{2}=x^{3}-x$ over $\mathbb{R}$

The group law
Example curve: $y^{2}=x^{3}-x$ over $\mathbb{R}$

## Point doubling

- Double the point

$$
P=(-0.7,0.5975)
$$

## Point doubling

- Double the point
$P=(-0.7,0.5975)$
- Compute the tangent on $P$

The group law
Example curve: $y^{2}=x^{3}-x$ over $\mathbb{R}$

## Point doubling

- Double the point

$$
P=(-0.7,0.5975)
$$

- Compute the tangent on $P$
- Determine second intersection $T=\left(x_{T}, y_{T}\right)$ with the elliptic curve

## Point doubling

- Double the point $P=(-0.7,0.5975)$
- Compute the tangent on $P$
- Determine second intersection $T=\left(x_{T}, y_{T}\right)$ with the elliptic curve
- Result of the addition:
$P+Q=\left(x_{T},-y_{T}\right)$

## Group law in formulas

Curve equation: $y^{2}=x^{3}+a x+b$

## Group law in formulas

Curve equation: $y^{2}=x^{3}+a x+b$
Point addition

- $P=\left(x_{P}, y_{P}\right), Q=\left(x_{Q}, y_{Q}\right) \rightarrow P+Q=R=\left(x_{R}, y_{R}\right)$ with

## Group law in formulas

Curve equation: $y^{2}=x^{3}+a x+b$
Point addition

- $P=\left(x_{P}, y_{P}\right), Q=\left(x_{Q}, y_{Q}\right) \rightarrow P+Q=R=\left(x_{R}, y_{R}\right)$ with
- $x_{R}=\left(\frac{y_{Q}-y_{P}}{x_{Q}-x_{P}}\right)^{2}-x_{P}-x_{Q}$
- $y_{R}=\left(\frac{y_{Q}-y_{P}}{x_{Q}-x_{P}}\right)\left(x_{P}-x_{R}\right)-y_{P}$

## Group law in formulas

Curve equation: $y^{2}=x^{3}+a x+b$
Point addition

- $P=\left(x_{P}, y_{P}\right), Q=\left(x_{Q}, y_{Q}\right) \rightarrow P+Q=R=\left(x_{R}, y_{R}\right)$ with
- $x_{R}=\left(\frac{y_{Q}-y_{P}}{x_{Q}-x_{P}}\right)^{2}-x_{P}-x_{Q}$
- $y_{R}=\left(\frac{y_{Q}-y_{P}}{x_{Q}-x_{P}}\right)\left(x_{P}-x_{R}\right)-y_{P}$

Point doubling

- $P=\left(x_{P}, y_{P}\right), 2 P=\left(x_{R}, y_{R}\right)$ with

## Group law in formulas

Curve equation: $y^{2}=x^{3}+a x+b$
Point addition

- $P=\left(x_{P}, y_{P}\right), Q=\left(x_{Q}, y_{Q}\right) \rightarrow P+Q=R=\left(x_{R}, y_{R}\right)$ with
- $x_{R}=\left(\frac{y_{Q}-y_{P}}{x_{Q}-x_{P}}\right)^{2}-x_{P}-x_{Q}$
- $y_{R}=\left(\frac{y_{Q}-y_{P}}{x_{Q}-x_{P}}\right)\left(x_{P}-x_{R}\right)-y_{P}$

## Point doubling

- $P=\left(x_{P}, y_{P}\right), 2 P=\left(x_{R}, y_{R}\right)$ with
- $x_{R}=\left(\frac{3 x_{P}^{2}+a}{2 y_{P}}\right)^{2}-2 x_{P}$
- $y_{R}=\left(\frac{3 x_{P}^{2}+a}{2 y_{P}}\right)\left(x_{P}-x_{R}\right)-y_{P}$

## More Weierstrass curve group law

- Neutral element is $\mathcal{O}$
- Inverse of a point $(x, y)$ is $(x,-y)$

## More Weierstrass curve group law

- Neutral element is $\mathcal{O}$
- Inverse of a point $(x, y)$ is $(x,-y)$
- Note: Formulas don't work for $P+(-P)$, also don't work for $\mathcal{O}$
- Need to distinguish these cases!

## More Weierstrass curve group law

- Neutral element is $\mathcal{O}$
- Inverse of a point $(x, y)$ is $(x,-y)$
- Note: Formulas don't work for $P+(-P)$, also don't work for $\mathcal{O}$
- Need to distinguish these cases!
- "Uniform" addition law in Hıșl|'s Ph.D. thesis, Section 5.5.2 (http://eprints.qut.edu.au/33233/):
- Move special cases to other points
- Not safe to use on arbitrary input points!

## More Weierstrass curve group law

- Neutral element is $\mathcal{O}$
- Inverse of a point $(x, y)$ is $(x,-y)$
- Note: Formulas don't work for $P+(-P)$, also don't work for $\mathcal{O}$
- Need to distinguish these cases!
- "Uniform" addition law in Hıșl|'s Ph.D. thesis, Section 5.5.2 (http://eprints.qut.edu.au/33233/):
- Move special cases to other points
- Not safe to use on arbitrary input points!
- Formulas for curves over $\mathbb{F}_{2^{k}}$ look slightly different, but same special cases

## Finding a suitable curve

## Security requirements for ECC

- $\ell=\left|E\left(\mathbb{F}_{q}\right)\right|$ must have large prime-order subgroup
- For $n$ bits of security we need $2 n$-bit prime-order subgroup

## Finding a suitable curve

## Security requirements for ECC

- $\ell=\left|E\left(\mathbb{F}_{q}\right)\right|$ must have large prime-order subgroup
- For $n$ bits of security we need $2 n$-bit prime-order subgroup
- Impossible to transfer DLP to less secure groups:
- $\ell$ must not be equal to $q$
- We need $\ell \nmid p^{k}-1$ for small $k$

## Finding a suitable curve

## Security requirements for ECC

- $\ell=\left|E\left(\mathbb{F}_{q}\right)\right|$ must have large prime-order subgroup
- For $n$ bits of security we need $2 n$-bit prime-order subgroup
- Impossible to transfer DLP to less secure groups:
- $\ell$ must not be equal to $q$
- We need $\ell \nmid p^{k}-1$ for small $k$

## Finding a curve

- Fix finite field $\mathbb{F}_{q}$ of suitable size
- Fix curve parameter $a$ (quite common: $a=-3$ )
- Pick curve parameter $b$ until $E$ fulfills desired properties
- This requires efficient "point counting"
- This requires efficient factorization or primality proving

## Standardized curves

"The nice thing about standards is that you have so many to choose from.

## Standardized curves

"The nice thing about standards is that you have so many to choose from." - Andrew S. Tanenbaum

- Various standardized curves, most well-known: NIST curves:
- Big-prime field curves with $192,224,256,384$, and 521 bits
- Binary curves with $163,233,283,409$, and 571 bits
- Binary Koblitz curves with $163,233,283,409$, and 571 bits

## Standardized curves

"The nice thing about standards is that you have so many to choose from." - Andrew S. Tanenbaum

- Various standardized curves, most well-known: NIST curves:
- Big-prime field curves with 192, 224, 256, 384, and 521 bits
- Binary curves with $163,233,283,409$, and 571 bits
- Binary Koblitz curves with 163, 233, 283, 409, and 571 bits
- SECG curves (Certicom), prime-field and binary curves

## Standardized curves

"The nice thing about standards is that you have so many to choose from." - Andrew S. Tanenbaum

- Various standardized curves, most well-known: NIST curves:
- Big-prime field curves with 192, 224, 256, 384, and 521 bits
- Binary curves with $163,233,283,409$, and 571 bits
- Binary Koblitz curves with $163,233,283$, 409, and 571 bits
- SECG curves (Certicom), prime-field and binary curves
- Brainpool curves (BSI), only prime-field curves

## Standardized curves

"The nice thing about standards is that you have so many to choose from." - Andrew S. Tanenbaum

- Various standardized curves, most well-known: NIST curves:
- Big-prime field curves with 192, 224, 256, 384, and 521 bits

- Binary Koblitz curves with $163,233,283$, 409, and 571 bits
- SECG curves (Certicom), prime-field and binary curves
- Brainpool curves (BSI), only prime-field curves
- FRP256v1 (ANSSI), one prime-field curve (256 bits)

## Binary vs. big prime

Curves over big-prime fields

- Many fields of a given size $\Rightarrow$ many curves
- Efficient in software (can use hardware multipliers)
- Less efficient in hardware

## Binary vs. big prime

## Curves over big-prime fields

- Many fields of a given size $\Rightarrow$ many curves
- Efficient in software (can use hardware multipliers)
- Less efficient in hardware

## Curves over binary fields

- Important for security: exponent $k$ in $\mathbb{F}_{p^{k}}$ has to be prime
- Not many fields (not that many curves)
- More efficient in hardware
- Efficient in software only on some microarchitectures
- A hell to implement securely in software on some other microarchitectures

## Putting it together

- Choose security level (e.g., 128 bits)

## Putting it together

- Choose security level (e.g., 128 bits)
- Decide whether you want binary or big-prime field arithmetic, let's say big prime

## Putting it together

- Choose security level (e.g., 128 bits)
- Decide whether you want binary or big-prime field arithmetic, let's say big prime
- Pick corresponding standard curve, e.g., NIST-P256

## Putting it together

- Choose security level (e.g., 128 bits)
- Decide whether you want binary or big-prime field arithmetic, let's say big prime
- Pick corresponding standard curve, e.g., NIST-P256
- Implement field arithmetic

## Putting it together

- Choose security level (e.g., 128 bits)
- Decide whether you want binary or big-prime field arithmetic, let's say big prime
- Pick corresponding standard curve, e.g., NIST-P256
- Implement field arithmetic
- Implement ECC addition and doubling

## Putting it together

- Choose security level (e.g., 128 bits)
- Decide whether you want binary or big-prime field arithmetic, let's say big prime
- Pick corresponding standard curve, e.g., NIST-P256
- Implement field arithmetic
- Implement ECC addition and doubling
- Implement scalar multiplication (next lecture)

## Putting it together

- Choose security level (e.g., 128 bits)
- Decide whether you want binary or big-prime field arithmetic, let's say big prime
- Pick corresponding standard curve, e.g., NIST-P256
- Implement field arithmetic
- Implement ECC addition and doubling
- Implement scalar multiplication (next lecture)
- You're done with ECDH software

## Putting it together

- Choose security level (e.g., 128 bits)
- Decide whether you want binary or big-prime field arithmetic, let's say big prime
- Pick corresponding standard curve, e.g., NIST-P256
- Implement field arithmetic
- Implement ECC addition and doubling
- Implement scalar multiplication (next lecture)
- You're done with BAD (!) ECDH software

## Problem I: inversions

## Inversions

- Adding $P=\left(x_{P}, y_{P}\right)$ and $Q=\left(x_{Q}, y_{Q}\right)$ needs an inversion in $\mathbb{F}_{q}$
- Inversions are expensive
- Constant-time inversions are even more expensive

## Problem I: inversions

## Inversions

- Adding $P=\left(x_{P}, y_{P}\right)$ and $Q=\left(x_{Q}, y_{Q}\right)$ needs an inversion in $\mathbb{F}_{q}$
- Inversions are expensive
- Constant-time inversions are even more expensive

Solution: projective coordinates

- Store fractions of elements of $\mathbb{F}_{q}$, invert only once at the end

## Problem I: inversions

## Inversions

- Adding $P=\left(x_{P}, y_{P}\right)$ and $Q=\left(x_{Q}, y_{Q}\right)$ needs an inversion in $\mathbb{F}_{q}$
- Inversions are expensive
- Constant-time inversions are even more expensive

## Solution: projective coordinates

- Store fractions of elements of $\mathbb{F}_{q}$, invert only once at the end
- Represent points in projective coordinates: $P=\left(X_{P}: Y_{P}: Z_{P}\right)$ with $x_{P}=X_{P} / Z_{P}$ and $y_{P}=Y_{P} / Z_{P}$
- The point $(1: 1: 0)$ is the point at infinity

## Problem I: inversions

## Inversions

- Adding $P=\left(x_{P}, y_{P}\right)$ and $Q=\left(x_{Q}, y_{Q}\right)$ needs an inversion in $\mathbb{F}_{q}$
- Inversions are expensive
- Constant-time inversions are even more expensive

## Solution: projective coordinates

- Store fractions of elements of $\mathbb{F}_{q}$, invert only once at the end
- Represent points in projective coordinates: $P=\left(X_{P}: Y_{P}: Z_{P}\right)$ with $x_{P}=X_{P} / Z_{P}$ and $y_{P}=Y_{P} / Z_{P}$
- The point $(1: 1: 0)$ is the point at infinity
- Also possible: weighted projective coordinates:
- Jacobian coordinates: $P=\left(X_{P}: Y_{P}: Z_{P}\right)$ with $x_{P}=X_{P} / Z_{P}^{2}$ and $y_{P}=Y_{P} / Z_{P}^{3}$
- López-Dahab coordinates (for binary curves): $P=\left(X_{P}: Y_{P}: Z_{P}\right)$ with $x_{P}=X_{P} / Z_{P}$ and $y_{P}=Y_{P} / Z_{P}^{2}$

## Problem I: inversions

## Inversions

- Adding $P=\left(x_{P}, y_{P}\right)$ and $Q=\left(x_{Q}, y_{Q}\right)$ needs an inversion in $\mathbb{F}_{q}$
- Inversions are expensive
- Constant-time inversions are even more expensive

## Solution: projective coordinates

- Store fractions of elements of $\mathbb{F}_{q}$, invert only once at the end
- Represent points in projective coordinates: $P=\left(X_{P}: Y_{P}: Z_{P}\right)$ with $x_{P}=X_{P} / Z_{P}$ and $y_{P}=Y_{P} / Z_{P}$
- The point $(1: 1: 0)$ is the point at infinity
- Also possible: weighted projective coordinates:
- Jacobian coordinates: $P=\left(X_{P}: Y_{P}: Z_{P}\right)$ with $x_{P}=X_{P} / Z_{P}^{2}$ and $y_{P}=Y_{P} / Z_{P}^{3}$
- López-Dahab coordinates (for binary curves): $P=\left(X_{P}: Y_{P}: Z_{P}\right)$ with $x_{P}=X_{P} / Z_{P}$ and $y_{P}=Y_{P} / Z_{P}^{2}$
- Important: Never send projective representation, always convert to affine!

## Problem II: group-law special cases

- Addition of $P+Q$ needs to distinguish different cases:
- If $P=\mathcal{O}$ return $Q$
- Else if $Q=\mathcal{O}$ return $P$
- Else if $P=Q$ call doubling routine
- Else if $P=-Q$ return $\mathcal{O}$
- Else use addition formulas

## Problem II: group-law special cases

- Addition of $P+Q$ needs to distinguish different cases:
- If $P=\mathcal{O}$ return $Q$
- Else if $Q=\mathcal{O}$ return $P$
- Else if $P=Q$ call doubling routine
- Else if $P=-Q$ return $\mathcal{O}$
- Else use addition formulas
- Similar for doubling $P$ :
- If $P=\mathcal{O}$ return $P$
- Else if $y_{P}=0$ return $\mathcal{O}$
- Else use doubling formulas

## Problem II: group-law special cases

- Addition of $P+Q$ needs to distinguish different cases:
- If $P=\mathcal{O}$ return $Q$
- Else if $Q=\mathcal{O}$ return $P$
- Else if $P=Q$ call doubling routine
- Else if $P=-Q$ return $\mathcal{O}$
- Else use addition formulas
- Similar for doubling $P$ :
- If $P=\mathcal{O}$ return $P$
- Else if $y_{P}=0$ return $\mathcal{O}$
- Else use doubling formulas
- Constant-time implementations of this are horrible

## Problem II: group-law special cases

- Addition of $P+Q$ needs to distinguish different cases:
- If $P=\mathcal{O}$ return $Q$
- Else if $Q=\mathcal{O}$ return $P$
- Else if $P=Q$ call doubling routine
- Else if $P=-Q$ return $\mathcal{O}$
- Else use addition formulas
- Similar for doubling $P$ :
- If $P=\mathcal{O}$ return $P$
- Else if $y_{P}=0$ return $\mathcal{O}$
- Else use doubling formulas
- Constant-time implementations of this are horrible
- Good news: Can avoid the checks when computing $k \cdot P$ and $k<\left|E\left(\mathbb{F}_{q}\right)\right|$

## Problem II: group-law special cases

- Addition of $P+Q$ needs to distinguish different cases:
- If $P=\mathcal{O}$ return $Q$
- Else if $Q=\mathcal{O}$ return $P$
- Else if $P=Q$ call doubling routine
- Else if $P=-Q$ return $\mathcal{O}$
- Else use addition formulas
- Similar for doubling $P$ :
- If $P=\mathcal{O}$ return $P$
- Else if $y_{P}=0$ return $\mathcal{O}$
- Else use doubling formulas
- Constant-time implementations of this are horrible
- Good news: Can avoid the checks when computing $k \cdot P$ and $k<\left|E\left(\mathbb{F}_{q}\right)\right|$
- Bad news: Side-channel countermeasures use $k>\left|E\left(\mathbb{F}_{q}\right)\right|$

## Problem II: group-law special cases

- Addition of $P+Q$ needs to distinguish different cases:
- If $P=\mathcal{O}$ return $Q$
- Else if $Q=\mathcal{O}$ return $P$
- Else if $P=Q$ call doubling routine
- Else if $P=-Q$ return $\mathcal{O}$
- Else use addition formulas
- Similar for doubling $P$ :
- If $P=\mathcal{O}$ return $P$
- Else if $y_{P}=0$ return $\mathcal{O}$
- Else use doubling formulas
- Constant-time implementations of this are horrible
- Good news: Can avoid the checks when computing $k \cdot P$ and $k<\left|E\left(\mathbb{F}_{q}\right)\right|$
- Bad news: Side-channel countermeasures use $k>\left|E\left(\mathbb{F}_{q}\right)\right|$
- More bad news: Doesn't work for multi-scalar multiplication (next lecture)

## Problem II: group-law special cases

- Addition of $P+Q$ needs to distinguish different cases:
- If $P=\mathcal{O}$ return $Q$
- Else if $Q=\mathcal{O}$ return $P$
- Else if $P=Q$ call doubling routine
- Else if $P=-Q$ return $\mathcal{O}$
- Else use addition formulas
- Similar for doubling $P$ :
- If $P=\mathcal{O}$ return $P$
- Else if $y_{P}=0$ return $\mathcal{O}$
- Else use doubling formulas
- Constant-time implementations of this are horrible
- Good news: Can avoid the checks when computing $k \cdot P$ and $k<\left|E\left(\mathbb{F}_{q}\right)\right|$
- Bad news: Side-channel countermeasures use $k>\left|E\left(\mathbb{F}_{q}\right)\right|$
- More bad news: Doesn't work for multi-scalar multiplication (next lecture)
- Baseline: simple implementations are likely to be wrong or insecure

## Solution I: Montgomery ladder

- Use Montgomery curve: $E_{M}: B y^{2}=x^{3}+A x^{2}+x$.
- Use $x$-coordinate-only differential addition chain ("Montgomery ladder'", next lecture)

## Solution I: Montgomery ladder

- Use Montgomery curve: $E_{M}: B y^{2}=x^{3}+A x^{2}+x$.
- Use $x$-coordinate-only differential addition chain ("Montgomery ladder", next lecture)
- Advantages:
- Works on all inputs, no special cases
- Very regular structure, easy to protect against timing attacks
- Point compression/decompression for free

## Solution I: Montgomery ladder

- Use Montgomery curve: $E_{M}: B y^{2}=x^{3}+A x^{2}+x$.
- Use $x$-coordinate-only differential addition chain ("Montgomery ladder'", next lecture)
- Advantages:
- Works on all inputs, no special cases
- Very regular structure, easy to protect against timing attacks
- Point compression/decompression for free
- Easy to implement, harder to screw up in hard-to-detect ways
- Simple implementations are likely to be correct and secure

## Solution I: Montgomery ladder

- Use Montgomery curve: $E_{M}: B y^{2}=x^{3}+A x^{2}+x$.
- Use $x$-coordinate-only differential addition chain ("Montgomery ladder", next lecture)
- Advantages:
- Works on all inputs, no special cases
- Very regular structure, easy to protect against timing attacks
- Point compression/decompression for free
- Easy to implement, harder to screw up in hard-to-detect ways
- Simple implementations are likely to be correct and secure
- Disadvantages:
- Not all curves can be converted to Montgomery shape
- Always have a cofactor of at least 4
- Ladders on general Weierstrass curves are much less efficient

## Solution I: Montgomery ladder

- Use Montgomery curve: $E_{M}: B y^{2}=x^{3}+A x^{2}+x$.
- Use $x$-coordinate-only differential addition chain ("Montgomery ladder", next lecture)
- Advantages:
- Works on all inputs, no special cases
- Very regular structure, easy to protect against timing attacks
- Point compression/decompression for free
- Easy to implement, harder to screw up in hard-to-detect ways
- Simple implementations are likely to be correct and secure
- Disadvantages:
- Not all curves can be converted to Montgomery shape
- Always have a cofactor of at least 4
- Ladders on general Weierstrass curves are much less efficient
- We only get the $x$ coordinate of the result, tricky for signatures
- Can reconstruct $y$, but that involves some additional cost

## Solution II: (twisted) Edwards curves

- Edwards, 2007: New form for elliptic curves ("Edwards curves")
- Bernstein, Lange, 2007: very fast addition and doubling on these curves
- Bernstein, Birkner, Joye, Lange, Peters, 2008: generalize the idea to "twisted Edwards curves"

## Solution II: (twisted) Edwards curves

- Edwards, 2007: New form for elliptic curves ("Edwards curves")
- Bernstein, Lange, 2007: very fast addition and doubling on these curves
- Bernstein, Birkner, Joye, Lange, Peters, 2008: generalize the idea to "twisted Edwards curves"
- Core advantage of (twisted) Edwards curves: complete group law
- No need to handle special cases
- No "point at infinity" to work with

## Solution II: (twisted) Edwards curves

- Edwards, 2007: New form for elliptic curves ("Edwards curves")
- Bernstein, Lange, 2007: very fast addition and doubling on these curves
- Bernstein, Birkner, Joye, Lange, Peters, 2008: generalize the idea to "twisted Edwards curves"
- Core advantage of (twisted) Edwards curves: complete group law
- No need to handle special cases
- No "point at infinity" to work with
- Can speed up doubling, but addition formulas work for $P+P$

## Solution II: (twisted) Edwards curves

- Edwards, 2007: New form for elliptic curves ("Edwards curves")
- Bernstein, Lange, 2007: very fast addition and doubling on these curves
- Bernstein, Birkner, Joye, Lange, Peters, 2008: generalize the idea to "twisted Edwards curves"
- Core advantage of (twisted) Edwards curves: complete group law
- No need to handle special cases
- No "point at infinity" to work with
- Can speed up doubling, but addition formulas work for $P+P$
- Efficient (for cryptography) transformation from Weierstrass to (twisted) Edwards only for some curves

## Solution II: (twisted) Edwards curves

- Edwards, 2007: New form for elliptic curves ("Edwards curves")
- Bernstein, Lange, 2007: very fast addition and doubling on these curves
- Bernstein, Birkner, Joye, Lange, Peters, 2008: generalize the idea to "twisted Edwards curves"
- Core advantage of (twisted) Edwards curves: complete group law
- No need to handle special cases
- No "point at infinity" to work with
- Can speed up doubling, but addition formulas work for $P+P$
- Efficient (for cryptography) transformation from Weierstrass to (twisted) Edwards only for some curves
- Always efficient: transformation between Montgomery curves and twisted Edwards curves

## Solution II: (twisted) Edwards curves

- Edwards, 2007: New form for elliptic curves ("Edwards curves")
- Bernstein, Lange, 2007: very fast addition and doubling on these curves
- Bernstein, Birkner, Joye, Lange, Peters, 2008: generalize the idea to "twisted Edwards curves"
- Core advantage of (twisted) Edwards curves: complete group law
- No need to handle special cases
- No "point at infinity" to work with
- Can speed up doubling, but addition formulas work for $P+P$
- Efficient (for cryptography) transformation from Weierstrass to (twisted) Edwards only for some curves
- Always efficient: transformation between Montgomery curves and twisted Edwards curves
- Again: simple implementations are likely to be correct and secure

## Solution II: (twisted) Edwards curves

- Edwards, 2007: New form for elliptic curves ("Edwards curves")
- Bernstein, Lange, 2007: very fast addition and doubling on these curves
- Bernstein, Birkner, Joye, Lange, Peters, 2008: generalize the idea to "twisted Edwards curves"
- Core advantage of (twisted) Edwards curves: complete group law
- No need to handle special cases
- No "point at infinity" to work with
- Can speed up doubling, but addition formulas work for $P+P$
- Efficient (for cryptography) transformation from Weierstrass to (twisted) Edwards only for some curves
- Always efficient: transformation between Montgomery curves and twisted Edwards curves
- Again: simple implementations are likely to be correct and secure
- Disadvantage: always have a cofactor of at least 4

## Disclosure of a Major Bug in CryptoNote Based Currencies

Posted by: luigi1111 and Riccardo "fluffypony" Spagni
May 17, 2017

Overview

In Monero we've discovered and patched a critical bug that affects all CryptoNote based cryptocurrencies, and allows for the creation of an unlimited number of coins in a way that is undetectable to an observer unless they know about the fatal flaw and can search for it.

## So, what's the deal with the cofactor?

- Protocols need to be careful to avoid subgroup attacks
- Monero screwed this up, which allowed double-spending
- Elegant solution: "Ristretto" encoding by Hamburg, see: https:// github.com/otrv4/libgoldilocks

## Solution III: Complete group law on Weierstrass curves

- Bosma, Lenstra, 1995: complete group law for Weierstrass curves
- Problem: Extremely inefficient

## Solution III: Complete group law on Weierstrass curves

- Bosma, Lenstra, 1995: complete group law for Weierstrass curves
- Problem: Extremely inefficient
- Renes, Costello, Batina, 2016: Much faster complete group law for Weierstrass curves
- Less efficient than (twisted) Edwards
- Overhead quite architecture-dependent (Schwabe, Sprenkels, 2019)
- Covers all curves

## Problem III: Wrong-curve attacks

## ECDH attack scenario

- Alice sends point on different (insecure) curve with small subgroup
- Bob computes "shared key" in that small subgroup
- Alice learns "shared key" through brute force
- Alice learns Bob's secret scalar modulo the order of the small subgroup

## Problem III: Wrong-curve attacks

## ECDH attack scenario

- Alice sends point on different (insecure) curve with small subgroup
- Bob computes "shared key" in that small subgroup
- Alice learns "shared key" through brute force
- Alice learns Bob's secret scalar modulo the order of the small subgroup

## Countermeasures

- Check that input point is on the curve (functional tests will miss this!)

## Problem III: Wrong-curve attacks

## ECDH attack scenario

- Alice sends point on different (insecure) curve with small subgroup
- Bob computes "shared key" in that small subgroup
- Alice learns "shared key" through brute force
- Alice learns Bob's secret scalar modulo the order of the small subgroup

## Countermeasures

- Check that input point is on the curve (functional tests will miss this!)
- Send compressed points ( $x$, parity $(y)$ ); decompression returns $(x, y)$ on the curve or fails

## Problem III: Wrong-curve attacks

## ECDH attack scenario

- Alice sends point on different (insecure) curve with small subgroup
- Bob computes "shared key" in that small subgroup
- Alice learns "shared key" through brute force
- Alice learns Bob's secret scalar modulo the order of the small subgroup

## Countermeasures

- Check that input point is on the curve (functional tests will miss this!)
- Send compressed points ( $x$, parity $(y)$ ); decompression returns $(x, y)$ on the curve or fails
- Send only $x$ (Montgomery ladder); but: $x$ could still be on the "twist" of $E$
- Make sure that the twist is also secure ("twist security")

## Problem IV: Backdoors in standards?

""I no longer trust the [NIST Elliptic Curves] constants. I believe the NSA has manipulated them through their relationships with industry." - Bruce Schneier, 2013.

## Problem IV: Backdoors in standards?

"II no longer trust the [NIST Elliptic Curves] constants. I believe the NSA has manipulated them through their relationships with industry." - Bruce Schneier, 2013.

- It is pretty clear that NSA put a backdoor in Dual_EC_DRBG
- Constants of NIST curves have been obtained by hashing random values
- No-backdoor claim: We know the preimages

## Problem IV: Backdoors in standards?

"II no longer trust the [NIST Elliptic Curves] constants. I believe the NSA has manipulated them through their relationships with industry." - Bruce Schneier, 2013.

- It is pretty clear that NSA put a backdoor in Dual_EC_DRBG
- Constants of NIST curves have been obtained by hashing random values
- No-backdoor claim: We know the preimages
- Possible attack if you know a class of vulnerable curves: Generate random seeds until you have found a vulnerable (and seemingly secure) curve

## Problem IV: Backdoors in standards?

"II no longer trust the [NIST Elliptic Curves] constants. I believe the NSA has manipulated them through their relationships with industry." - Bruce Schneier, 2013.

- It is pretty clear that NSA put a backdoor in Dual_EC_DRBG
- Constants of NIST curves have been obtained by hashing random values
- No-backdoor claim: We know the preimages
- Possible attack if you know a class of vulnerable curves: Generate random seeds until you have found a vulnerable (and seemingly secure) curve
- Fact: There are no known insecurities of NIST curves

## Problem IV: Backdoors in standards?

"II no longer trust the [NIST Elliptic Curves] constants. I believe the NSA has manipulated them through their relationships with industry." - Bruce Schneier, 2013.

- It is pretty clear that NSA put a backdoor in Dual_EC_DRBG
- Constants of NIST curves have been obtained by hashing random values
- No-backdoor claim: We know the preimages
- Possible attack if you know a class of vulnerable curves: Generate random seeds until you have found a vulnerable (and seemingly secure) curve
- Fact: There are no known insecurities of NIST curves
- Fact: There is no proof that there are no intentional vulnerabilities in NIST curves

## Problem IV: Backdoors in standards?

"II no longer trust the [NIST Elliptic Curves] constants. I believe the NSA has manipulated them through their relationships with industry." - Bruce Schneier, 2013.

- It is pretty clear that NSA put a backdoor in Dual_EC_DRBG
- Constants of NIST curves have been obtained by hashing random values
- No-backdoor claim: We know the preimages
- Possible attack if you know a class of vulnerable curves: Generate random seeds until you have found a vulnerable (and seemingly secure) curve
- Fact: There are no known insecurities of NIST curves
- Fact: There is no proof that there are no intentional vulnerabilities in NIST curves
- For more details, see BADA55 elliptic curves

## Choosing a safe curve

Overview of various elliptic curves and thorough security analysis by Bernstein and Lange:

> https://safecurves.cr.yp.to
(doesn't list cofactor-1 curves, so best to combine with Ristretto)

## Point representation and arithmetic

Collection of elliptic-curve shapes, point representations and group-operation formulas by Bernstein and Lange:
https://www.hyperelliptic.org/EFD/
