Network Security Traffic analysis and anonymization

Radboud University, The Netherlands

Spring 2017

 Best protection against active and passive attackers: encrypt and authenticate all traffic

- Best protection against active and passive attackers: encrypt and authenticate all traffic
- Different security for encryption on different layers:

- Best protection against active and passive attackers: encrypt and authenticate all traffic
- Different security for encryption on different layers:
 - Link-layer: protection between two network "neighbors" (example: WPA2)

- Best protection against active and passive attackers: encrypt and authenticate all traffic
- Different security for encryption on different layers:
 - Link-layer: protection between two network "neighbors" (example: WPA2)
 - Network layer: encryption between two nodes (example: IPsec)

- Best protection against active and passive attackers: encrypt and authenticate all traffic
- Different security for encryption on different layers:
 - Link-layer: protection between two network "neighbors" (example: WPA2)
 - Network layer: encryption between two nodes (example: IPsec)
 - Transport layer: encryption between client and server process (example: SSL/TLS)

- Best protection against active and passive attackers: encrypt and authenticate all traffic
- Different security for encryption on different layers:
 - Link-layer: protection between two network "neighbors" (example: WPA2)
 - Network layer: encryption between two nodes (example: IPsec)
 - Transport layer: encryption between client and server process (example: SSL/TLS)
 - Application layer: end-to-end encryption between applications (example: PGP)

- Best protection against active and passive attackers: encrypt and authenticate all traffic
- Different security for encryption on different layers:
 - Link-layer: protection between two network "neighbors" (example: WPA2)
 - Network layer: encryption between two nodes (example: IPsec)
 - Transport layer: encryption between client and server process (example: SSL/TLS)
 - Application layer: end-to-end encryption between applications (example: PGP)
- ▶ IPsec has two modes of operation: transport and tunneling

- Best protection against active and passive attackers: encrypt and authenticate all traffic
- Different security for encryption on different layers:
 - Link-layer: protection between two network "neighbors" (example: WPA2)
 - Network layer: encryption between two nodes (example: IPsec)
 - Transport layer: encryption between client and server process (example: SSL/TLS)
 - Application layer: end-to-end encryption between applications (example: PGP)
- IPsec has two modes of operation: transport and tunneling
- IPsec has two main protocols: authentication headers (AH) and encapsulating security payloads (ESP)

- Best protection against active and passive attackers: encrypt and authenticate all traffic
- Different security for encryption on different layers:
 - Link-layer: protection between two network "neighbors" (example: WPA2)
 - Network layer: encryption between two nodes (example: IPsec)
 - Transport layer: encryption between client and server process (example: SSL/TLS)
 - Application layer: end-to-end encryption between applications (example: PGP)
- IPsec has two modes of operation: transport and tunneling
- IPsec has two main protocols: authentication headers (AH) and encapsulating security payloads (ESP)
- IPsec's Security Associations (SA) establish unidirectional security relations

- Best protection against active and passive attackers: encrypt and authenticate all traffic
- Different security for encryption on different layers:
 - Link-layer: protection between two network "neighbors" (example: WPA2)
 - Network layer: encryption between two nodes (example: IPsec)
 - Transport layer: encryption between client and server process (example: SSL/TLS)
 - Application layer: end-to-end encryption between applications (example: PGP)
- IPsec has two modes of operation: transport and tunneling
- IPsec has two main protocols: authentication headers (AH) and encapsulating security payloads (ESP)
- IPsec's Security Associations (SA) establish unidirectional security relations
- TLS uses (long) handshake to agree on cipher suites, establish session keys

- Best protection against active and passive attackers: encrypt and authenticate all traffic
- Different security for encryption on different layers:
 - Link-layer: protection between two network "neighbors" (example: WPA2)
 - Network layer: encryption between two nodes (example: IPsec)
 - Transport layer: encryption between client and server process (example: SSL/TLS)
 - Application layer: end-to-end encryption between applications (example: PGP)
- ▶ IPsec has two modes of operation: transport and tunneling
- IPsec has two main protocols: authentication headers (AH) and encapsulating security payloads (ESP)
- IPsec's Security Associations (SA) establish unidirectional security relations
- TLS uses (long) handshake to agree on cipher suites, establish session keys
- Most cipher suites in TLS have (or had) some problems

How much web traffic is encrypted?

How much web traffic is encrypted?

Encrypted Web Traffic More Than Doubles After NSA Revelations

No crypto

From the article:

"Early last year-before the Snowden revelations-encrypted traffic accounted for 2.29 percent of all peak hour traffic in North America, according to Sandvine's report. Now, it spans 3.8 percent. But that's a small jump compared to other parts of the world. In Europe, encrypted traffic went from 1.47 percent to 6.10 percent, and in Latin America, it increased from 1.8 percent to 10.37 percent."

-Klint Finley on wired.com, May 16, 2014.

... update from 2015

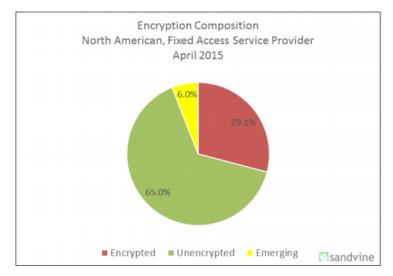

Figure 1 - Encryption Composition - North America, Fixed Access - April 2015

... estimated for 2016

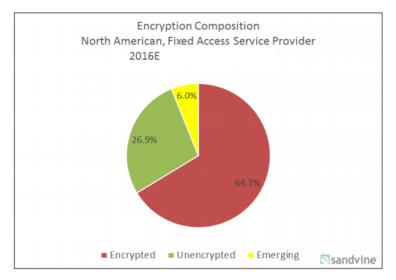

Figure 2 - Encryption Composition - North America, Fixed Access - 2016 Estimate

... estimated for 2016

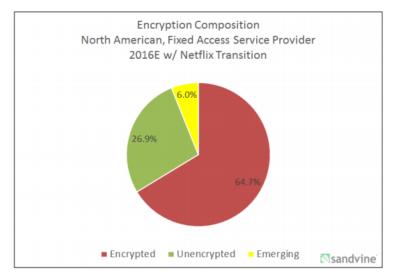

Figure 2 - Encryption Composition - North America, Fixed Access - 2016 Estimate

How much web traffic is encrypted?

How much web traffic is encrypted?

Imagine a world in which ...

• ... all Internet traffic is encrypted and authenticated,

- ▶ ... all Internet traffic is encrypted and authenticated,
- ... e-mails are all PGP encrypted and signed,

- ▶ ... all Internet traffic is encrypted and authenticated,
- ... e-mails are all PGP encrypted and signed,
- ... everybody is using cipher suites that offer high security,

- ... all Internet traffic is encrypted and authenticated,
- ... e-mails are all PGP encrypted and signed,
- ... everybody is using cipher suites that offer high security,
- ... all trusted parties are trustworthy,

- ▶ ... all Internet traffic is encrypted and authenticated,
- ... e-mails are all PGP encrypted and signed,
- ... everybody is using cipher suites that offer high security,
- ... all trusted parties are trustworthy,
- crypto implementations are correct and secure,

- ... all Internet traffic is encrypted and authenticated,
- ... e-mails are all PGP encrypted and signed,
- ... everybody is using cipher suites that offer high security,
- ... all trusted parties are trustworthy,
- crypto implementations are correct and secure,
- ... applied cryptographers have trouble finding a job.

EU's Data Retention Directive (annulled 2014)

"Member States shall ensure that the categories of data specified in Article 5 are retained for periods of not less than six months and not more than two years from the date of the communication."

EU's Data Retention Directive (annulled 2014)

"Member States shall ensure that the categories of data specified in Article 5 are retained for periods of not less than six months and not more than two years from the date of the communication."

- data necessary to trace and identify the source of a communication
- data necessary to identify the destination of a communication

EU's Data Retention Directive (annulled 2014)

"Member States shall ensure that the categories of data specified in Article 5 are retained for periods of not less than six months and not more than two years from the date of the communication."

- data necessary to trace and identify the source of a communication
- data necessary to identify the destination of a communication
- data necessary to identify the date, time and duration of a communication

EU's Data Retention Directive (annulled 2014)

"Member States shall ensure that the categories of data specified in Article 5 are retained for periods of not less than six months and not more than two years from the date of the communication."

- data necessary to trace and identify the source of a communication
- data necessary to identify the destination of a communication
- data necessary to identify the date, time and duration of a communication
- data necessary to identify the type of communication

EU's Data Retention Directive (annulled 2014)

"Member States shall ensure that the categories of data specified in Article 5 are retained for periods of not less than six months and not more than two years from the date of the communication."

- data necessary to trace and identify the source of a communication
- data necessary to identify the destination of a communication
- data necessary to identify the date, time and duration of a communication
- data necessary to identify the type of communication
- data necessary to identify users' communication equipment or what purports to be their equipment

EU's Data Retention Directive (annulled 2014)

"Member States shall ensure that the categories of data specified in Article 5 are retained for periods of not less than six months and not more than two years from the date of the communication."

- data necessary to trace and identify the source of a communication
- data necessary to identify the destination of a communication
- data necessary to identify the date, time and duration of a communication
- data necessary to identify the type of communication
- data necessary to identify users' communication equipment or what purports to be their equipment
- data necessary to identify the location of mobile communication equipment

EU's Data Retention Directive (annulled 2014)

"Member States shall ensure that the categories of data specified in Article 5 are retained for periods of not less than six months and not more than two years from the date of the communication."

From Article 5:

- data necessary to trace and identify the source of a communication
- data necessary to identify the destination of a communication
- data necessary to identify the date, time and duration of a communication
- data necessary to identify the type of communication
- data necessary to identify users' communication equipment or what purports to be their equipment
- data necessary to identify the location of mobile communication equipment

Encrypting and authenticating content does not prevent any of this!

"Metadata absolutely tells you everything about somebody's life. If you have enough metadata you don't really need content... [It's] sort of embarrassing how predictable we are as human beings."

-Stewart Baker, former general counsel of the NSA

"Metadata absolutely tells you everything about somebody's life. If you have enough metadata you don't really need content... [It's] sort of embarrassing how predictable we are as human beings." —Stewart Baker, former general counsel of the NSA

"We kill people based on metadata."

-Michael Hayden, former director of the NSA and the CIA

Is "metadata" all an attacker gets?

- Common assumption: an attacker sees only traffic data ("meta data")
- Example, interview with Jimmy Wales (Wikipedia founder):

"You've said that you're going to start encrypting communications on Wikipedia as a result...

We have done. It's not completely finished yet but the only thing that GCHQ, hopefully, can see is that you're looking at Wikipedia. They can't see which article you're reading. It's not the government's business to know what everybody is reading."

- Common assumption: an attacker sees only traffic data ("meta data")
- Example, interview with Jimmy Wales (Wikipedia founder):

"You've said that you're going to start encrypting communications on Wikipedia as a result...

- Small experiment: 10 Wikipedia pages, load one at random through HTTPS
- Attacker sniffs the network, tries to figure out which one

- Common assumption: an attacker sees only traffic data ("meta data")
- Example, interview with Jimmy Wales (Wikipedia founder):

"You've said that you're going to start encrypting communications on Wikipedia as a result...

- Small experiment: 10 Wikipedia pages, load one at random through HTTPS
- Attacker sniffs the network, tries to figure out which one

- Common assumption: an attacker sees only traffic data ("meta data")
- Example, interview with Jimmy Wales (Wikipedia founder):

"You've said that you're going to start encrypting communications on Wikipedia as a result...

- Small experiment: 10 Wikipedia pages, load one at random through HTTPS
- Attacker sniffs the network, tries to figure out which one

- Common assumption: an attacker sees only traffic data ("meta data")
- Example, interview with Jimmy Wales (Wikipedia founder):

"You've said that you're going to start encrypting communications on Wikipedia as a result...

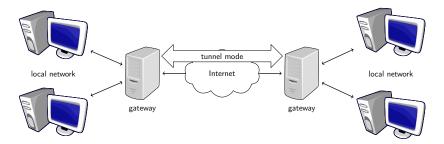

- Small experiment: 10 Wikipedia pages, load one at random through HTTPS
- Attacker sniffs the network, tries to figure out which one
- Not that hard:
 - ▶ 10 webpages have different amount of pictures
 - \blacktriangleright 10 webpages have different (length of) URLs to pictures
 - Attacker can Count bytes of requests to image server

- Common assumption: an attacker sees only traffic data ("meta data")
- Example, interview with Jimmy Wales (Wikipedia founder):

"You've said that you're going to start encrypting communications on Wikipedia as a result...

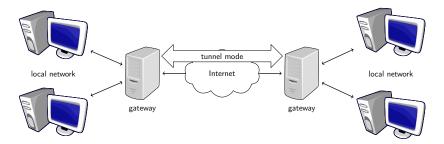

- Small experiment: 10 Wikipedia pages, load one at random through HTTPS
- Attacker sniffs the network, tries to figure out which one
- ► Not that hard:
 - ▶ 10 webpages have different amount of pictures
 - \blacktriangleright 10 webpages have different (length of) URLs to pictures
 - Attacker can Count bytes of requests to image server
 - This is not the only thing an attacker sees: number of requests, delays, same for replies...

IPsec ESP in tunnel mode

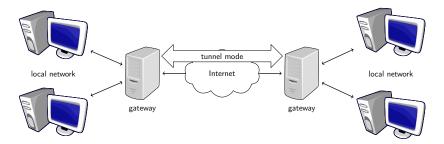

- Everything between the gateways has the gateways' addresses
- Nodes behind the gateways are indistinguishable
- ▶ RFC 2406 calls this "limited traffic flow confidentiality"

IPsec ESP in tunnel mode

- Everything between the gateways has the gateways' addresses
- Nodes behind the gateways are indistinguishable
- ▶ RFC 2406 calls this "limited traffic flow confidentiality"
- Problem 1: Does not help against state-level attacker who can request gateway's logfiles

IPsec ESP in tunnel mode

- Everything between the gateways has the gateways' addresses
- Nodes behind the gateways are indistinguishable
- ▶ RFC 2406 calls this "limited traffic flow confidentiality"
- Problem 1: Does not help against state-level attacker who can request gateway's logfiles
- Problem 2: Potentially small anonymity set

- Somewhat similar idea (without crypto): use a proxy server
- Typically: application-specific proxies (e.g., HTTP proxies)
- Requests to websites come from proxy
- All users behind the proxy are indistinguishable
- Various problems:
 - 1. Single point of failure against state-level attackers

- Somewhat similar idea (without crypto): use a proxy server
- Typically: application-specific proxies (e.g., HTTP proxies)
- Requests to websites come from proxy
- All users behind the proxy are indistinguishable
- Various problems:
 - 1. Single point of failure against state-level attackers
 - 2. Proxy somewhere in the Internet: easy to correlate ingoing/outgoing traffic

- Somewhat similar idea (without crypto): use a proxy server
- Typically: application-specific proxies (e.g., HTTP proxies)
- Requests to websites come from proxy
- All users behind the proxy are indistinguishable
- Various problems:
 - 1. Single point of failure against state-level attackers
 - 2. Proxy somewhere in the Internet: easy to correlate ingoing/outgoing traffic
 - 3. No crypto protection to the proxy

- Somewhat similar idea (without crypto): use a proxy server
- Typically: application-specific proxies (e.g., HTTP proxies)
- Requests to websites come from proxy
- All users behind the proxy are indistinguishable
- Various problems:
 - 1. Single point of failure against state-level attackers
 - 2. Proxy somewhere in the Internet: easy to correlate ingoing/outgoing traffic
 - 3. No crypto protection to the proxy
- Can add crypto to the proxy (e.g., OpenVPN Service)
- That still does not solve problems 1 and 2

- Idea for anonymous electronic mail by Chaum, 1981: mixing networks
- \blacktriangleright Assume that Alice wants to anonymously send message M to Bob

- Idea for anonymous electronic mail by Chaum, 1981: mixing networks
- \blacktriangleright Assume that Alice wants to anonymously send message M to Bob
- ▶ Uses intermediate computer called *mix* and public keys
 - K_B of Bob, and
 - ► K_M of the mix

- Idea for anonymous electronic mail by Chaum, 1981: mixing networks
- \blacktriangleright Assume that Alice wants to anonymously send message M to Bob
- Uses intermediate computer called *mix* and public keys
 - K_B of Bob, and
 - K_M of the mix
- Sends to mix: $K_M(R_1, K_B(R_0, M), B)$ for random R_0, R_1

- Idea for anonymous electronic mail by Chaum, 1981: mixing networks
- \blacktriangleright Assume that Alice wants to anonymously send message M to Bob
- Uses intermediate computer called *mix* and public keys
 - K_B of Bob, and
 - K_M of the mix
- Sends to mix: $K_M(R_1, K_B(R_0, M), B)$ for random R_0, R_1
- Mix collects many such mails, decrypts to $(K_B(R_0, M), B)$

- Idea for anonymous electronic mail by Chaum, 1981: mixing networks
- \blacktriangleright Assume that Alice wants to anonymously send message M to Bob
- Uses intermediate computer called *mix* and public keys
 - K_B of Bob, and
 - K_M of the mix
- Sends to mix: $K_M(R_1, K_B(R_0, M), B)$ for random R_0, R_1
- Mix collects many such mails, decrypts to $(K_B(R_0, M), B)$
- Sends mails in lexicographic order to receivers
- Receiver Bob decrypts and obtains M

- Idea for anonymous electronic mail by Chaum, 1981: mixing networks
- \blacktriangleright Assume that Alice wants to anonymously send message M to Bob
- Uses intermediate computer called *mix* and public keys
 - K_B of Bob, and
 - K_M of the mix
- Sends to mix: $K_M(R_1, K_B(R_0, M), B)$ for random R_0, R_1
- Mix collects many such mails, decrypts to $(K_B(R_0, M), B)$
- Sends mails in lexicographic order to receivers
- \blacktriangleright Receiver Bob decrypts and obtains M
- Achieves anonymity if encrypted messages are indistinguishable
- Very important: never repeat input and output!
- Has high communication latency (wait for enough messages)

- Now Alice can send mail to Bob, how about replies?
- Need a way for Bob to reply without revealing Alice's address/identity

- Now Alice can send mail to Bob, how about replies?
- Need a way for Bob to reply without revealing Alice's address/identity
- ► Alice includes a return address in her message encrypted to Bob:

$$K_M(R_1, A_X), K_X$$

- R_1, K_X are random one-time symmetric keys
- A_X is Alice's real address

- Now Alice can send mail to Bob, how about replies?
- Need a way for Bob to reply without revealing Alice's address/identity
- ► Alice includes a return address in her message encrypted to Bob:

$$K_M(R_1, A_X), K_X$$

- R_1, K_X are random one-time symmetric keys
- ► A_X is Alice's real address
- \blacktriangleright Bob can send response M as

 $K_M(R_1, A_X), K_X(R_0, M)$

- Now Alice can send mail to Bob, how about replies?
- Need a way for Bob to reply without revealing Alice's address/identity
- ► Alice includes a return address in her message encrypted to Bob:

$$K_M(R_1, A_X), K_X$$

- R_1, K_X are random one-time symmetric keys
- ► A_X is Alice's real address
- \blacktriangleright Bob can send response M as

$$K_M(R_1, A_X), K_X(R_0, M)$$

• Mix receives and recovers R_1, A_X , sends to Alice

$$R_1(K_X(R_0, M))$$

- Now Alice can send mail to Bob, how about replies?
- Need a way for Bob to reply without revealing Alice's address/identity
- ► Alice includes a return address in her message encrypted to Bob:

$$K_M(R_1, A_X), K_X$$

- R_1, K_X are random one-time symmetric keys
- ► A_X is Alice's real address
- \blacktriangleright Bob can send response M as

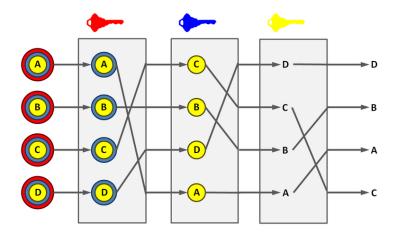

$$K_M(R_1, A_X), K_X(R_0, M)$$

• Mix receives and recovers R_1, A_X , sends to Alice

```
R_1(K_X(R_0, M))
```

• Only Alice can decrypt, because only she knows both K_X and R_1

Cascading Mixes

Mix Nets

+ No single point of failure (with cascading)
+ Inbound/output-traffic analysis does not de-anonymize

+ Generally good anonymity

Mix Nets

+ No single point of failure (with cascading)

+ Inbound/output-traffic analysis does not de-anonymize

+ Generally good anonymity

Slow public-key cryptography (at least in vanilla mix nets)

Long latency

Mix Nets

+ No single point of failure (with cascading)

+ Inbound/output-traffic analysis does not de-anonymize

- + Generally good anonymity
- Slow public-key cryptography (at least in vanilla mix nets)

Long latency

Anon. Proxies

- + Low latency
- + No overhead from slow crypto

Mix Nets

+ No single point of failure (with cascading)

+ Inbound/output-traffic analysis does not de-anonymize

+ Generally good anonymity

Slow public-key cryptography (at least in vanilla mix nets)

Long latency

Anon. Proxies

- + Low latency
- + No overhead from slow crypto
- Single point of failure
- Inbound/output-traffic analysis de-anonymizes
- Fairly weak anonymity

Mix Nets

+ No single point of failure (with cascading)

+ Inbound/output-traffic analysis does not de-anonymize

+ Generally good anonymity

Slow public-key cryptography (at least in vanilla mix nets)

Long latency

Anon. Proxies

- + Low latency
- + No overhead from slow crypto
- Single point of failure
- Inbound/output-traffic analysis de-anonymizes
- Fairly weak anonymity

Idea of Tor (The Onion Router): Combine advantages:

- ▶ Use cascade of "proxies", called Tor relays or Tor nodes
- Use fast symmetric crypto instead of asymmetric crypto

- Assume that user shares symmetric keys with three *relays*:
 - Entry relay R_1 (key K_{R_1})
 - Middle relay R_2 (key K_{R_2})
 - Exit relay R₃ (key K_{R3})

 Wants to anonymously send request to www.wikileaks.org

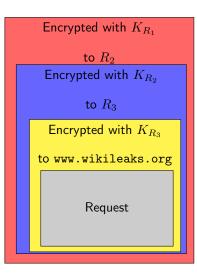

Encrypted with K_{R_3} to www.wikileaks.org Request

- Assume that user shares symmetric keys with three *relays*:
 - Entry relay R_1 (key K_{R_1})
 - Middle relay R_2 (key K_{R_2})
 - Exit relay R₃ (key K_{R3})
- Wants to anonymously send request to www.wikileaks.org
- Prepares packet as follows:
 - Write dest. www.wikileaks.org, encrypt with K_{R3}

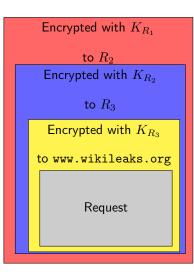

- Assume that user shares symmetric keys with three *relays*:
 - Entry relay R_1 (key K_{R_1})
 - Middle relay R_2 (key K_{R_2})
 - Exit relay R₃ (key K_{R3})
- Wants to anonymously send request to www.wikileaks.org
- Prepares packet as follows:
 - Write dest. www.wikileaks.org, encrypt with K_{R3}
 - Write dest. R_3 encrypt with K_{R_2}

 Assume that user shares symmetric keys with three *relays*:

- Entry relay R_1 (key K_{R_1})
- Middle relay R₂ (key K_{R2})
- Exit relay R₃ (key K_{R3})
- Wants to anonymously send request to www.wikileaks.org
- Prepares packet as follows:
 - Write dest. www.wikileaks.org, encrypt with K_{R3}
 - Write dest. R_3 encrypt with K_{R_2}
 - Write dest. R_2 encrypt with K_{R_1}

 Assume that user shares symmetric keys with three *relays*:

- Entry relay R_1 (key K_{R_1})
- Middle relay R₂ (key K_{R2})
- Exit relay R₃ (key K_{R3})
- Wants to anonymously send request to www.wikileaks.org
- Prepares packet as follows:
 - Write dest. www.wikileaks.org, encrypt with K_{R3}
 - Write dest. R_3 encrypt with K_{R_2}
 - Write dest. R_2 encrypt with K_{R_1}
- ▶ Send this packet to R₁

▶ R₁ receives packet, removes encryption with K_{R1}

- ▶ R₁ receives packet, removes encryption with K_{R1}
- Sees next destination: R_2 , forwards

- ▶ R₁ receives packet, removes encryption with K_{R1}
- Sees next destination: R₂, forwards
- ▶ R₂ receives packet, removes encryption with K_{R2}

- ▶ R₁ receives packet, removes encryption with K_{R1}
- ▶ Sees next destination: R₂, forwards
- ▶ R₂ receives packet, removes encryption with K_{R2}
- Sees next destination: R₃, forwards

Encrypted with K_{R_3} to www.wikileaks.org Request

- ▶ R₁ receives packet, removes encryption with K_{R1}
- Sees next destination: R₂, forwards
- ▶ R₂ receives packet, removes encryption with K_{R2}
- ▶ Sees next destination: R₃, forwards
- ▶ R₃ receives packet, removes encryption with K_{R3}

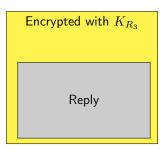

to www.wikileaks.org

Request

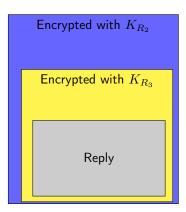

- ▶ R₁ receives packet, removes encryption with K_{R1}
- ▶ Sees next destination: R₂, forwards
- ▶ R₂ receives packet, removes encryption with K_{R2}
- Sees next destination: R_3 , forwards
- R₃ receives packet, removes encryption with K_{R3}
- Sees next destination: www.wikileaks.org, sends request

 R₃ receives reply from www.wikileaks.org

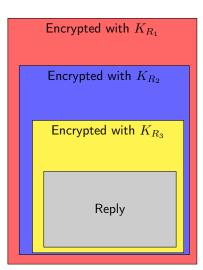

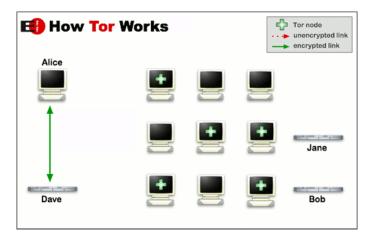

- R₃ receives reply from www.wikileaks.org
- R_3 encrypts with K_{R_3} , sends to R_2

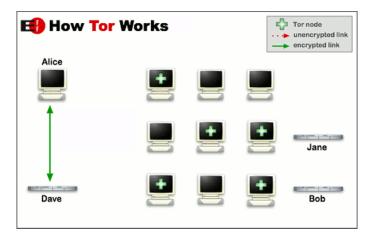

- R₃ receives reply from www.wikileaks.org
- R_3 encrypts with K_{R_3} , sends to R_2
- R_2 encrypts with K_{R_2} , sends to R_1

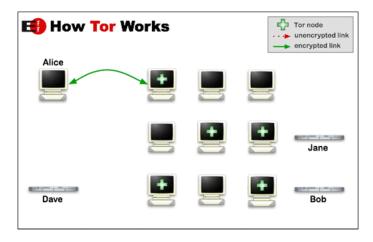

- R₃ receives reply from www.wikileaks.org
- R_3 encrypts with K_{R_3} , sends to R_2
- R_2 encrypts with K_{R_2} , sends to R_1
- ▶ R₁ encrypts with K_{R1}, sends to Tor client

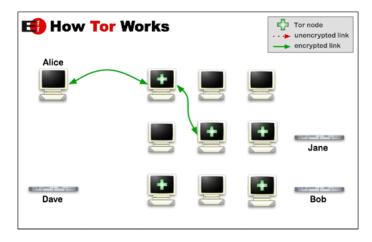

Request listing of Tor nodes from directory server (DS)

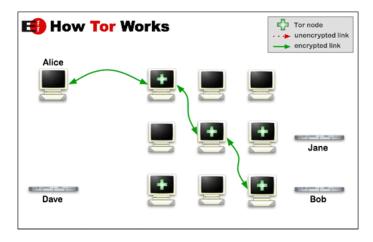

Pick entry, middle, and exit node; obtain their public keys from DS

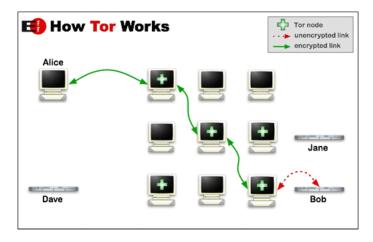

Exchange symmetric key with entry node (Diffie-Hellman)

Exchange key with middle node (proxied by entry node!)

Exchange key with exit node (proxied by entry and middle node!)

Communicate with Bob (www.wikileaks.org)

- Tor offers anonymity up to the transport layer
- Tor cannot offer application-level anonymity
- Example: I connect through Tor to a website and enter on that website:

- Tor offers anonymity up to the transport layer
- Tor cannot offer application-level anonymity
- Example: I connect through Tor to a website and enter on that website:

- Various Bittorrent clients do precisely this: send the IP address as part of application data
- Conclusion: Bittorrent over Tor isn't a good idea

- Tor offers anonymity up to the transport layer
- Tor cannot offer application-level anonymity
- Example: I connect through Tor to a website and enter on that website:

- Various Bittorrent clients do precisely this: send the IP address as part of application data
- Conclusion: Bittorrent over Tor isn't a good idea
- Browsers are easily identifiable, see Panopticlick by EFF
- Conclusion: Use the Tor browser (modified Firefox)

- Tor offers anonymity up to the transport layer
- Tor cannot offer application-level anonymity
- Example: I connect through Tor to a website and enter on that website:

- Various Bittorrent clients do precisely this: send the IP address as part of application data
- Conclusion: Bittorrent over Tor isn't a good idea
- Browsers are easily identifiable, see Panopticlick by EFF
- Conclusion: Use the Tor browser (modified Firefox)
- Tor re-uses an existing circuit for new TCP connections for 10 minutes
- Leaking your IP address to Bittorrent may also de-anonymize your browser session (bad apple attack)!

- ▶ Tor provides anonymity as long as *not all three* relays attack *together*
- Possible attack: control all three relays on a path
- > Anybody can run Tor relays, so can, for example, the NSA

- ▶ Tor provides anonymity as long as *not all three* relays attack *together*
- Possible attack: control all three relays on a path
- Anybody can run Tor relays, so can, for example, the NSA
- \blacktriangleright Let's assume that NSA runs 1% of the Tor relays
- Each circuit has a 1/1,000,000 chance to be fully controlled by NSA

- ▶ Tor provides anonymity as long as *not all three* relays attack *together*
- Possible attack: control all three relays on a path
- Anybody can run Tor relays, so can, for example, the NSA
- \blacktriangleright Let's assume that NSA runs 1% of the Tor relays
- Each circuit has a 1/1,000,000 chance to be fully controlled by NSA
- Possible solution: longer circuits (problem: slower, less reliable)

- ▶ Tor provides anonymity as long as *not all three* relays attack *together*
- Possible attack: control all three relays on a path
- Anybody can run Tor relays, so can, for example, the NSA
- \blacktriangleright Let's assume that NSA runs 1% of the Tor relays
- \blacktriangleright Each circuit has a 1/1,000,000 chance to be fully controlled by NSA
- Possible solution: longer circuits (problem: slower, less reliable)
- Better solution: more non-NSA relays

- Tor is aiming at low latency (for web browsing etc.)
- Tor does not wait for traffic to do mixing

- Tor is aiming at low latency (for web browsing etc.)
- Tor does not wait for traffic to do mixing
- (Timing) correlation attack is still possible:
 - Think of the whole Tor network as one big proxy
 - Correlate traffic going into and out of this proxy

- Tor is aiming at low latency (for web browsing etc.)
- Tor does not wait for traffic to do mixing
- (Timing) correlation attack is still possible:
 - Think of the whole Tor network as one big proxy
 - Correlate traffic going into and out of this proxy
- Conclusion by Felix von Leitner (Fefe) on Aug 5, 2013:

"Tor ist tot. Tor basiert auf der Annahme, dass der Gegner nicht in der Lage ist, das gesamte Internet zu überwachen."

- Tor is aiming at low latency (for web browsing etc.)
- Tor does not wait for traffic to do mixing
- (Timing) correlation attack is still possible:
 - Think of the whole Tor network as one big proxy
 - Correlate traffic going into and out of this proxy
- Conclusion by Felix von Leitner (Fefe) on Aug 5, 2013:

"Tor is dead. Tor is based on the assumption, that the opponent does not have the whole Internet under surveillance"

- Tor is aiming at low latency (for web browsing etc.)
- Tor does not wait for traffic to do mixing
- (Timing) correlation attack is still possible:
 - Think of the whole Tor network as one big proxy
 - Correlate traffic going into and out of this proxy
- Conclusion by Felix von Leitner (Fefe) on Aug 5, 2013:

"Tor is dead. Tor is based on the assumption, that the opponent does not have the whole Internet under surveillance"

Very controversial discussion ensued... see http://blog.fefe.de/?ts=af0134f5

"Tor stinks"

- Snowden leaked NSA slides "Tor stinks" from 2007
- Quotes from these slides:

"We will never be able to de-anonymize all Tor users all the time."

"With manual analysis we can de-anonymize a very small fraction of Tor users, however <u>no</u> success de-anonymizing a user in response to a TOPI request/on demand."

- Various countries filter Internet traffic by destination address
- Most prominent example: Golden Shield Project ("Great Firewall of China")

- Various countries filter Internet traffic by destination address
- Most prominent example: Golden Shield Project ("Great Firewall of China")
- ▶ Firewalls and gateways cannot see the true destination of Tor traffic
- ► Tor is a powerful tool to circumvent censorship (e.g., in China)

- Various countries filter Internet traffic by destination address
- Most prominent example: Golden Shield Project ("Great Firewall of China")
- ▶ Firewalls and gateways cannot see the true destination of Tor traffic
- ► Tor is a powerful tool to circumvent censorship (e.g., in China)
- Can also use Tor to circumvent country filters:
 - ▶ Need an IP address in the US: use Tor with US exit node

- Various countries filter Internet traffic by destination address
- Most prominent example: Golden Shield Project ("Great Firewall of China")
- Firewalls and gateways cannot see the true destination of Tor traffic
- ► Tor is a powerful tool to circumvent censorship (e.g., in China)
- Can also use Tor to circumvent country filters:
 - Need an IP address in the US: use Tor with US exit node
 - Need access to a specific paper: use Tor with exit node in some university

- Easy solution for censors:
 - Obtain list of Tor nodes from directory server
 - Block access to the Tor network (all relays)

- Easy solution for censors:
 - Obtain list of Tor nodes from directory server
 - Block access to the Tor network (all relays)
- Solution: Tor bridges (entry notes that are not in the public list)
- Obtain IP address of a bridge by
 - visiting https://bridges.torproject.org/
 - writing e-mail to bridges@torproject.org

- Easy solution for censors:
 - Obtain list of Tor nodes from directory server
 - Block access to the Tor network (all relays)
- Solution: Tor bridges (entry notes that are not in the public list)
- Obtain IP address of a bridge by
 - visiting https://bridges.torproject.org/
 - writing e-mail to bridges@torproject.org
- Censors can also block Tor by identifying Tor traffic
- ▶ Tor traffic is relatively easy to identify:
 - Disguised as HTTPS traffic, but
 - uses random domain names
 - has a characteristic packet-size distribution

- Censors can also block Tor by identifying Tor traffic
- ▶ Tor traffic is relatively easy to identify:
 - Disguised as HTTPS traffic, but
 - uses random domain names
 - has a characteristic packet-size distribution
- Solution: fully disguise Tor traffic as other traffic
- Pluggable Transport API allows communication between ofuscator and Tor client
