# Engineering Cryptographic Software Symmetric crypto in software

Peter Schwabe
Radboud University, Nijmegen, The Netherlands

Winter 2025/26

#### Primitives and algorithms

▶ Block ciphers: AES, Serpent, DES (and 3DES), IDEA, Present, LED, Prince, Klein, . . .

#### Primitives and algorithms

- ▶ Block ciphers: AES, Serpent, DES (and 3DES), IDEA, Present, LED, Prince, Klein, . . .
- ► Stream ciphers: RC4, Salsa20, ChaCha20, HC-128, Rabbit, SOSEMANUK, Grain, MICKEY, Trivium, . . .

#### Primitives and algorithms

- ▶ Block ciphers: AES, Serpent, DES (and 3DES), IDEA, Present, LED, Prince, Klein, . . .
- ► Stream ciphers: RC4, Salsa20, ChaCha20, HC-128, Rabbit, SOSEMANUK, Grain, MICKEY, Trivium, . . .
- ► Hash functions: SHA-256, SHA-512, SHA-3, Blake, Blake2, . . .

#### Primitives and algorithms

- ▶ Block ciphers: AES, Serpent, DES (and 3DES), IDEA, Present, LED, Prince, Klein, . . .
- ► Stream ciphers: RC4, Salsa20, ChaCha20, HC-128, Rabbit, SOSEMANUK, Grain, MICKEY, Trivium, . . .
- ► Hash functions: SHA-256, SHA-512, SHA-3, Blake, Blake2, . . .
- ▶ Authenticated encryption: AES-GCM, Poly-1305, CAESAR, . . .

#### Primitives and algorithms

- ▶ Block ciphers: AES, Serpent, DES (and 3DES), IDEA, Present, LED, Prince, Klein, . . .
- ► Stream ciphers: RC4, Salsa20, ChaCha20, HC-128, Rabbit, SOSEMANUK, Grain, MICKEY, Trivium, . . .
- ► Hash functions: SHA-256, SHA-512, SHA-3, Blake, Blake2, . . .
- ▶ Authenticated encryption: AES-GCM, Poly-1305, CAESAR, . . .

#### Architectures and microarchitectures

► Architectures: x86, AMD64, ARMv6, ARMv7, ARMv8, AVR, 32-bit PowerPC, 64-bit PowerPC, SPARCv9, . . .

#### Primitives and algorithms

#### Architectures and microarchitectures

- ► Architectures: x86, AMD64, ARMv6, ARMv7, ARMv8, AVR, 32-bit PowerPC, 64-bit PowerPC, SPARCv9, . . .
- Microarchitectures: Pentium 4, Penryn, Nehalem, Sandy Bridge, Haswell, Cortex-A8, Cortex-A9, Cortex-A53, ...
- ► Instruction-set extensions: SSE, SSE2, SSE3, SSSE3, AVX, AVX2, AltiVec, NEON, ...

- ▶ Block cipher Rijndael proposed by Rijmen, Daemen in 1998
- ► Selected as AES by NIST in October 2000

- ▶ Block cipher Rijndael proposed by Rijmen, Daemen in 1998
- ► Selected as AES by NIST in October 2000
- ▶ Block size: 128 bits (AES state:  $4 \times 4$  matrix of 16 bytes)
- Key size 128/192/256 bits (resp. 10/12/14 rounds)

- ▶ Block cipher Rijndael proposed by Rijmen, Daemen in 1998
- ► Selected as AES by NIST in October 2000
- ▶ Block size: 128 bits (AES state:  $4 \times 4$  matrix of 16 bytes)
- Key size  $\frac{128}{192}/\frac{256}{256}$  bits (resp.  $\frac{10}{12}/\frac{14}{14}$  rounds)

- ▶ Block cipher Rijndael proposed by Rijmen, Daemen in 1998
- ► Selected as AES by NIST in October 2000
- ▶ Block size: 128 bits (AES state:  $4 \times 4$  matrix of 16 bytes)
- $\blacktriangleright$  Key size  $\frac{128}{192}/256$  bits (resp.  $\frac{10}{12}/14$  rounds)
- ▶ AES with n rounds uses n+1 16-byte rounds keys  $K_0, \ldots, K_n$

- ▶ Block cipher Rijndael proposed by Rijmen, Daemen in 1998
- ► Selected as AES by NIST in October 2000
- ▶ Block size: 128 bits (AES state:  $4 \times 4$  matrix of 16 bytes)
- ightharpoonup Key size  $\frac{128}{192}/256$  bits (resp.  $\frac{10}{12}/14$  rounds)
- ▶ AES with n rounds uses n+1 16-byte rounds keys  $K_0, \ldots, K_n$
- ► Four operations per round: SUBBYTES, SHIFTROWS, MIXCOLUMNS, and ADDROUNDKEY
- ► Last round does not have MIXCOLUMNS

## High-level pseudocode AES-128

```
Require: 128-bit input block B, 128-bit AES round keys K_0, \ldots, K_{10}
Ensure: 128-bit block of encrypted output
   B \leftarrow AddRoundKey(B, K_0)
  for i from 1 to 9 do
       B \leftarrow \text{SubBytes}(B)
       B \leftarrow \text{ShiftRows}(B)
       B \leftarrow \text{MixColumns}(B)
       B \leftarrow \text{AddRoundKey}(B, K_i)
  end for
   B \leftarrow \text{SubBytes}(B)
   B \leftarrow \text{ShiftRows}(B)
   B \leftarrow \text{AddRoundKey}(B, K_{10})
  return B
```

## AES on 32-bit and 64-bit processors

- ▶ Idea from the AES proposal: Merge SUBBYTES, SHIFTROWS, and MIXCOLUMNS
- ▶ Use 4 lookup tables T0, T1, T2, and T3 (1 KB each)

## AES on 32-bit and 64-bit processors

- ▶ Idea from the AES proposal: Merge SUBBYTES, SHIFTROWS, and MIXCOLUMNS
- ▶ Use 4 lookup tables T0, T1, T2, and T3 (1 KB each)

#### The first round of AES in C

- ▶ Input: 32-bit integers y0, y1, y2, y3
- ▶ Output: 32-bit integers z0, z1, z2, z3
- ▶ Round keys in 32-bit-integer array rk [44]

## What a machine is really doing

```
unsigned char rk[176], T0[1024], T1[1024], T2[1024], T3[1024];
z0 = *(uint32 *)(rk + 16);
z1 = *(uint32 *)(rk + 20);
z2 = *(uint32 *)(rk + 24);
z3 = *(uint32 *)(rk + 28);
z0 ^= *(uint32 *) (T0 + ((y0 >> 22) & 0x3fc)) \
   ^ *(uint32 *) (T1 + ((y1 >> 14) & 0x3fc)) \
   ^{\star} (uint32 *) (T2 + ((y2 >> 6) & 0x3fc)) \
   ^ *(uint32 *) (T3 + ((y3 << 2) & 0x3fc));
z1 ^= *(uint32 *) (T0 + ((v1 >> 22) & 0x3fc)) 
   ^* *(uint32 *) (T1 + ((v2 >> 14) & 0x3fc)) \
   ^* *(uint32 *) (T2 + ((y3 >> 6) & 0x3fc)) \
   ^ *(uint32 *) (T3 + ((v0 << 2) & 0x3fc));
z2 ^= *(uint32 *) (T0 + ((y2 >> 22) & 0x3fc)) \
   ^ *(uint32 *) (T1 + ((y3 >> 14) & 0x3fc)) \
   ^* *(uint32 *) (T2 + ((y0 >> 6) & 0x3fc)) \
   ^ *(uint32 *) (T3 + ((y1 << 2) & 0x3fc));
z3 ^= *(uint32 *) (T0 + ((y3 >> 22) & 0x3fc)) \
   ^* *(uint32 *) (T1 + ((v0 >> 14) & 0x3fc)) \
   ^* *(uint32 *) (T2 + ((y1 >> 6) & 0x3fc)) \
   ^ *(uint32 *) (T3 + ((y2 << 2) & 0x3fc));
```

### AES instruction counts

Each round has 20 loads, 16 shifts, 16 masks and 16 xors

#### AES instruction counts

- ► Each round has 20 loads, 16 shifts, 16 masks and 16 xors
- ▶ Last round is slightly different: Needs 16 more mask instructions
- ▶ 4 load instructions to load input, 4 stores for output

#### AES instruction counts

- ► Each round has 20 loads, 16 shifts, 16 masks and 16 xors
- ▶ Last round is slightly different: Needs 16 more mask instructions
- 4 load instructions to load input, 4 stores for output
- ▶ In CTR mode: 4 xors with the key stream, incrementing the counter
- ...some more overhead
- ▶ Results in 720 instructions needed to encrypt a block of 16 bytes
- ▶ Specifically: 208 loads, 4 stores, 508 arithmetic instructions

## Case study: AES on an UltraSPARC

(My first project as Ph.D. student)

- ▶ 64-bit architecture
- ▶ Up to 4 instructions per cycle
- At most 2 integer-arithmetic instructions per cycle
- At most 1 load/store instruction per cycle
- ▶ 24 integer registers available

## Case study: AES on an UltraSPARC

(My first project as Ph.D. student)

- 64-bit architecture
- ► Up to 4 instructions per cycle
- ► At most 2 integer-arithmetic instructions per cycle
- At most 1 load/store instruction per cycle
- 24 integer registers available
- Previous AES speed:
  - 20.75 cycles/byte by Bernstein (public domain)

## Case study: AES on an UltraSPARC

(My first project as Ph.D. student)

- 64-bit architecture
- ► Up to 4 instructions per cycle
- At most 2 integer-arithmetic instructions per cycle
- At most 1 load/store instruction per cycle
- ► 24 integer registers available
- Previous AES speed:
  - 20.75 cycles/byte by Bernstein (public domain)
  - ► 16.875 cycles/byte (270 cycles/block) by Lipmaa (unpublished)

## Computing a lower bound

Reminder: 208 loads, 4 stores, 508 integer instructions per 16-byte block

- Only one load or store per cycle (⇒ at least 212 cycles)
- ▶ Only 2 arithmetic instructions per cycle (⇒ at least 254 cycles)

### Computing a lower bound

Reminder: 208 loads, 4 stores, 508 integer instructions per 16-byte block

- Only one load or store per cycle (⇒ at least 212 cycles)
- ▶ Only 2 arithmetic instructions per cycle (⇒ at least 254 cycles)

#### Making it fast

▶ After quite some instruction scheduling: 269 cycles per block

## Computing a lower bound

Reminder: 208 loads, 4 stores, 508 integer instructions per 16-byte block

- Only one load or store per cycle (⇒ at least 212 cycles)
- ▶ Only 2 arithmetic instructions per cycle (⇒ at least 254 cycles)

#### Making it fast

- ▶ After quite some instruction scheduling: 269 cycles per block
- My supervisor's reaction:
  - "... this is no time to relax; you have to not just beat Lipmaa's code, but beat it to a bloody pulp and dance on its grave. :-)"

## Computing a lower bound

Reminder: 208 loads, 4 stores, 508 integer instructions per 16-byte block

- ▶ Only one load or store per cycle (⇒ at least 212 cycles)
- ▶ Only 2 arithmetic instructions per cycle (⇒ at least 254 cycles)

#### Making it fast

- ▶ After quite some instruction scheduling: 269 cycles per block
- My supervisor's reaction:
  - "... this is no time to relax; you have to not just beat Lipmaa's code, but beat it to a bloody pulp and dance on its grave. :-)"
- After writing a simplified simulator and more instruction scheduling: 254 cycles/block, 15.98 cycles/byte

## Computing a lower bound

Reminder: 208 loads, 4 stores, 508 integer instructions per 16-byte block

- ▶ Only one load or store per cycle (⇒ at least 212 cycles)
- ▶ Only 2 arithmetic instructions per cycle (⇒ at least 254 cycles)

#### Making it fast

- ▶ After quite some instruction scheduling: 269 cycles per block
- My supervisor's reaction:
  - "... this is no time to relax; you have to not just beat Lipmaa's code, but beat it to a bloody pulp and dance on its grave. :-)"
- After writing a simplified simulator and more instruction scheduling: 254 cycles/block, 15.98 cycles/byte
- ▶ What now? Is this already a bloody pulp?

Lowering the lower bound

- ▶ We have to reduce the number of (arithmetic) instructions
- ▶ Idea: The UltraSPARC is a 64-bit architecture, pad 32-bit values with zeros, i.e.,
  - 0xc66363a5 becomes 0x0<u>c6</u>00<u>63</u>00<u>63</u>00<u>a5</u>0
- Do that consistently for values in registers, the tables and the round keys
- ▶ Interleave entries in tables TO and T1 and in T2 and T3

Lowering the lower bound

- We have to reduce the number of (arithmetic) instructions
- ▶ Idea: The UltraSPARC is a 64-bit architecture, pad 32-bit values with zeros, i.e.,
  - 0xc66363a5 becomes 0x0<u>c6</u>00<u>63</u>00<u>63</u>00<u>a5</u>0
- Do that consistently for values in registers, the tables and the round keys
- ▶ Interleave entries in tables TO and T1 and in T2 and T3

### Without padded registers

```
t0 = (uint32) y0 >> 22
t1 = (uint32) y0 >> 14
t2 = (uint32) y0 >> 6
t3 = (uint32) y0 << 2
t0 &= 0x3fc
t1 &= 0x3fc
t2 &= 0x3fc
```

## With padded registers

```
t0 = (uint64) y0 >> 48

t1 = (uint64) y0 >> 32

t2 = (uint64) y0 >> 16

t1 &= 0xff0

t2 &= 0xff0

t3 = y0 & 0xff0
```

Lowering the lower bound

- We have to reduce the number of (arithmetic) instructions
- ▶ Idea: The UltraSPARC is a 64-bit architecture, pad 32-bit values with zeros, i.e.,

0xc66363a5 becomes 0x0<u>c6</u>00<u>63</u>00<u>63</u>00<u>a5</u>0

- Do that consistently for values in registers, the tables and the round keys
- ▶ Interleave entries in tables TO and T1 and in T2 and T3
- ▶ Instruction set supports 32-bit shifts that zero out the upper 32 bits

## Without padded registers

```
t0 = (uint32) y0 >> 22
t1 = (uint32) y0 >> 14
t2 = (uint32) y0 >> 6
t3 = (uint32) y0 << 2
t0 &= 0x3fc
t1 &= 0x3fc
t2 &= 0x3fc
t3 &= 0x3fc
```

### With padded registers

```
t0 = (uint64) y0 >> 48
t1 = (uint64) y0 >> 32
t2 = (uint32) y0 >> 16
t1 &= 0xff0
t3 = y0 & 0xff0
```

Lowering the lower bound

- We have to reduce the number of (arithmetic) instructions
- ▶ Idea: The UltraSPARC is a 64-bit architecture, pad 32-bit values with zeros, i.e.,
  - 0xc66363a5 becomes 0x0<u>c6</u>00<u>63</u>00<u>63</u>00<u>a5</u>0
- Do that consistently for values in registers, the tables and the round keys
- ▶ Interleave entries in tables TO and T1 and in T2 and T3
- ▶ Instruction set supports 32-bit shifts that zero out the upper 32 bits
- Apply some more optimizations
- ► Final result: AES in CTR mode on UltraSPARC III at 12.06 cycles/byte

#### More arithmetic tricks for AES I

#### Combined Shift-and-mask

- Some architectures have combined shift-and-mask instructions (e.g., PowerPC)
- ► Combine 160 shifts and 160 masks and save 160 instructions

#### More arithmetic tricks for AES I

#### Combined Shift-and-mask

- Some architectures have combined shift-and-mask instructions (e.g., PowerPC)
- ► Combine 160 shifts and 160 masks and save 160 instructions

#### Scaled-index loads

- ► Some architectures can combine shift and load (e.g., x86, AMD64)
- Use this to get rid of the mask instruction for top and shift instruction for bottom byte
- ▶ Overall save: 80 instructions

#### More arithmetic tricks for AES II

## Various memory/arithmetic tradeoffs

- Can extract 4 bytes by one store and 4 loads
- ► Saves 160 mask instructions (or 320 if we have scaled-index loads)
- ► Costs 40 store and 160 load instructions

#### More arithmetic tricks for AES II

## Various memory/arithmetic tradeoffs

- Can extract 4 bytes by one store and 4 loads
- ▶ Saves 160 mask instructions (or 320 if we have scaled-index loads)
- ► Costs 40 store and 160 load instructions

## Counter-mode caching

- ► In CTR mode we encrypt a counter, then XOR keystream with plaintext
- ► Last counter byte only changes every 256 blocks
- ▶ Do computations depending on this byte in the first round only once, cache the state
- ▶ Similar in second round: only one 32-bit word changes every round
- ▶ Do computations depending on this word in the second round only once, cache the state
- ightharpoonup Overall save:  $\approx 100$  instructions

# Now forget everything we just said

#### Timing attacks

- ► The lookup-table-based approach is inherently vulnerable to cache-timing attacks
- ► Extensive literature on AES cache-timing attacks
- ▶ Osvik, Shamir, Tromer, 2006: Obtain AES-256 key in just 65 ms

# Now forget everything we just said

### Timing attacks

- ► The lookup-table-based approach is inherently vulnerable to cache-timing attacks
- ► Extensive literature on AES cache-timing attacks
- Osvik, Shamir, Tromer, 2006: Obtain AES-256 key in just 65 ms

### Then why did I tell you this?

- You have to be able to recognize and understand table-based AES implementations
- ▶ Optimizations show how to make best use of the instruction set
- General trick: Change your data representation

# Looking for an alternative approach

- ► Remember bitslicing: vectorized "hardware emulation"
- ► Every algorithm can be implemented with bitslicing
- ▶ Bitslicing is inherently protected against timing attacks

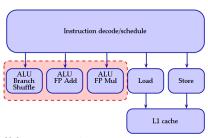

# Looking for an alternative approach

- ► Remember bitslicing: vectorized "hardware emulation"
- ▶ Every algorithm can be implemented with bitslicing
- ▶ Bitslicing is inherently protected against timing attacks
- ▶ Efficiency depends on algorithm and micro-architecture
- Some crypto primitives are designed for efficient bitslicing

# Looking for an alternative approach

- ► Remember bitslicing: vectorized "hardware emulation"
- Every algorithm can be implemented with bitslicing
- ▶ Bitslicing is inherently protected against timing attacks
- ▶ Efficiency depends on algorithm and micro-architecture
- ► Some crypto primitives are designed for efficient bitslicing
- ► AES was designed for table-based implementations
- ▶ Obvious question: Can bitsliced AES be fast?
- Common target for bitslicing AES: Intel Core 2

## The Intel Core 2 processor

- ► 16 128-bit XMM vector registers
- ▶ 16 64-bit integer registers
- SSE (Streaming SIMD Extension) instructions
  - followed by SSE2, SSE3, SSSE3 (Intel), SSE4 (Intel), SSE5 (AMD), AVX, AVX2 (Intel) etc.
- ▶ Native 128-bit wide execution units
- ▶ 3 ALUs up to 3 bit-logical instructions per cycle
- ightharpoonup Some differences between 65 nm (Core) and 45 nm (Penryn)

# Bitslicing AES on Intel Core 2 I

#### Matsui & Nakajima, 2007

- ▶ Process 128 blocks in parallel
- ▶ Performance: 9.2 cycles/byte
- Additional overhead for converting to/from bitsliced representation
- ► Great for, e.g., hard-disk encryption
- Bad for encryption of small Internet packets

# Bitslicing AES on Intel Core 2 I

### Matsui & Nakajima, 2007

- ▶ Process 128 blocks in parallel
- ▶ Performance: 9.2 cycles/byte
- Additional overhead for converting to/from bitsliced representation
- ► Great for, e.g., hard-disk encryption
- Bad for encryption of small Internet packets

### Könighofer, 2008

- ▶ Process only 4 blocks in parallel
- ► Use 64-bit integer registers
- ▶ Performance: 19.6 cycles/byte

- Similar idea to Könighofer:
  - ► Most expensive operation in AES is SubBytes
  - ► SUBBYTES is already 16-times parallel
  - Exploit this parallelism and reduce number of required blocks

- ► Similar idea to Könighofer:
  - ► Most expensive operation in AES is SubBytes
  - ► SubBytes is already 16-times parallel
  - Exploit this parallelism and reduce number of required blocks
- ▶ Different from Könighofer:
  - ▶ Use 128-bit XMM registers instead of 64-bit registers
  - ► Factor-2 speedup for doing more bit ops per instruction
  - Different optimization (need to use SSE\* instructions)

- ► Similar idea to Könighofer:
  - ► Most expensive operation in AES is SubBytes
  - ► SUBBYTES is already 16-times parallel
  - Exploit this parallelism and reduce number of required blocks
- ▶ Different from Könighofer:
  - ▶ Use 128-bit XMM registers instead of 64-bit registers
  - ► Factor-2 speedup for doing more bit ops per instruction
  - ▶ Different optimization (need to use SSE\* instructions)
- Use CTR mode (parallel and does not need decryption)

- ► Similar idea to Könighofer:
  - ► Most expensive operation in AES is SubBytes
  - ► SubBytes is already 16-times parallel
  - Exploit this parallelism and reduce number of required blocks
- Different from Könighofer:
  - ► Use 128-bit XMM registers instead of 64-bit registers
  - ► Factor-2 speedup for doing more bit ops per instruction
  - ▶ Different optimization (need to use SSE\* instructions)
- Use CTR mode (parallel and does not need decryption)
- Corresponding decryption later implemented by Azad (2011)
- ► Further improvements (including CTR-mode caching) by Park and Lee (2018)

# The Bitslicing approach

	row 0													 row 3										
	column 0			column 1			column2			column 3				 column 0				column 3						
block 0	block 1		block 7	plock 0	block 1		block 7	block 0	block 1		block 7	block 0	block 1		block 7	 block 0	block 1		block 7		block 0	block 1		block 7

- ▶ Process 8 AES blocks (= 128 bytes) in parallel
- ► Collect bits according to their position in the byte: i.e., the first register contains least significant bits from each byte, etc.
- ► AES state stored in 8 XMM registers
- ► Compute 128 S-Boxes in parallel, using bit-logical instructions
- ► For a simpler linear layer, collect the 8 bits from identical positions in each block into the same byte
- Never need to mix bits from different blocks all instructions byte-level

- ► Start from the most compact hardware S-box, 117 gates (Canright 2005; Boyar, Peralta, 2009)
- ▶ Use equivalent 128-bit bit-logical instructions

- ► Start from the most compact hardware S-box, 117 gates (Canright 2005; Boyar, Peralta, 2009)
- ▶ Use equivalent 128-bit bit-logical instructions
- ► Problem 1: instructions are two-operand, output overwrites one input
- ► Hence, sometimes need extra register-register moves to preserve input

- ► Start from the most compact hardware S-box, 117 gates (Canright 2005; Boyar, Peralta, 2009)
- Use equivalent 128-bit bit-logical instructions
- ► Problem 1: instructions are two-operand, output overwrites one input
- Hence, sometimes need extra register-register moves to preserve input
- ▶ Problem 2: not enough free registers for intermediate values
- Recompute some values multiple times (alternative: use stack)

- ► Start from the most compact hardware S-box, 117 gates (Canright 2005; Boyar, Peralta, 2009)
- Use equivalent 128-bit bit-logical instructions
- ► Problem 1: instructions are two-operand, output overwrites one input
- Hence, sometimes need extra register-register moves to preserve input
- ▶ Problem 2: not enough free registers for intermediate values
- Recompute some values multiple times (alternative: use stack)
- ► Total 163 instructions 15% shorter than previous results

	xor	and/or	mov	TOTAL
Hardware	82	35	_	117
Software	93	35	35	163

# Implementing the AES linear layer

- ► Each byte in the bitsliced vector corresponds to a different byte position in the AES state
- ► Thus, ShiftRows is a permutation of bytes
- ► Use SSSE3 dedicated byte-shuffle instruction pshufb
- ▶ Repeat for each bit position (register)  $\Rightarrow$  8 instructions
- ► MIXCOLUMNS uses byte shuffle and XOR, total 43 instructions
- ► ADDROUNDKEY also requires only 8 XORs from memory
- Some caveats:
  - ▶ Bitsliced key is larger  $-8 \times 128$  bits per round, key expansion slower
  - SSSE3 available only on Intel, not on AMD processors

## Putting it all together

	xor/and/or	pshufb/d	xor (mem-reg)	mov (reg-reg)	TOTAL
SubBytes	128	_	_	35	163
ShiftRows	-	8	_	-	8
MixColumns	27	16	_	_	43
AddRoundKey	_	_	8	_	8
TOTAL	155	24	8	35	222

- ▶ One AES round requires 222 instructions
- ► Last round omits MixColumns: 171 instructions
- ► Input/output transform 84 instructions/each
- Excluding data loading etc, we get a lower bound

$$\frac{222 \times 9 + 171 + 2 \times 84}{3 \times (8 \cdot 16)} \approx 6.1 \text{ cycles/byte}$$

► Actual performance on Core 2 (Penryn): 7.58 cycles/byte

21

- ► AltiVec offers a vperm instruction
  - ▶ 3 128-bit vector arguments: a, b, c
  - ▶ Replace each byte  $c_i$  in c by a byte from a or b, indexed by lowest 5 bits of  $c_i$

- ► AltiVec offers a vperm instruction
  - ▶ 3 128-bit vector arguments: a, b, c
  - ▶ Replace each byte  $c_i$  in c by a byte from a or b, indexed by lowest 5 bits of  $c_i$
- ► SSSE3 offers a pshufb instruction
  - ightharpoonup 2 128-bit vector arguments: a, c
  - ightharpoonup Shuffle bytes in a (in place) according to indices in c

- ► AltiVec offers a vperm instruction
  - ▶ 3 128-bit vector arguments: a, b, c
  - ▶ Replace each byte  $c_i$  in c by a byte from a or b, indexed by lowest 5 bits of  $c_i$
- ► SSSE3 offers a pshufb instruction
  - ▶ 2 128-bit vector arguments: a, c
  - ▶ Shuffle bytes in *a* (in place) according to indices in *c*
- ▶ For constant indices in c these instruction implement a permutation

- ► AltiVec offers a vperm instruction
  - ▶ 3 128-bit vector arguments: a, b, c
  - ▶ Replace each byte  $c_i$  in c by a byte from a or b, indexed by lowest 5 bits of  $c_i$
- ► SSSE3 offers a pshufb instruction
  - ▶ 2 128-bit vector arguments: a, c
  - ightharpoonup Shuffle bytes in a (in place) according to indices in c
- $\triangleright$  For constant indices in c these instruction implement a permutation
- ightharpoonup For constant inputs a,b they implement a lookup table
  - ▶ 5-bit to 8-bit lookup for vperm (32 entries)
  - ▶ 4-bit to 8-bit lookup for pshufb (16 entries)

- ▶ Idea by Hamburg (2009):
  - Use arithmetic representation of AES S-Box (inversion in  $\mathbb{F}_{28}$ )
  - lacktriangle Represent  $\mathbb{F}_{2^8}$  as quadratic extension of  $\mathbb{F}_{2^4}$
  - $\blacktriangleright$  Use vector-permute lookup tables for arithmetic in  $\mathbb{F}_{2^4}$

- ▶ Idea by Hamburg (2009):
  - lacktriangle Use arithmetic representation of AES S-Box (inversion in  $\mathbb{F}_{2^8}$ )
  - lacktriangle Represent  $\mathbb{F}_{2^8}$  as quadratic extension of  $\mathbb{F}_{2^4}$
  - lackbox Use vector-permute lookup tables for arithmetic in  $\mathbb{F}_{2^4}$
- Approach is fully constant time
- ► Not available on every architecture

- ▶ Idea by Hamburg (2009):
  - Use arithmetic representation of AES S-Box (inversion in  $\mathbb{F}_{2^8}$ )
  - lacktriangle Represent  $\mathbb{F}_{2^8}$  as quadratic extension of  $\mathbb{F}_{2^4}$
  - lacktriangle Use vector-permute lookup tables for arithmetic in  $\mathbb{F}_{2^4}$
- Approach is fully constant time
- Not available on every architecture
- Can combine with counter-mode caching

- ▶ Idea by Hamburg (2009):
  - Use arithmetic representation of AES S-Box (inversion in  $\mathbb{F}_{2^8}$ )
  - lacktriangle Represent  $\mathbb{F}_{2^8}$  as quadratic extension of  $\mathbb{F}_{2^4}$
  - lackbox Use vector-permute lookup tables for arithmetic in  $\mathbb{F}_{2^4}$
- ► Approach is fully constant time
- ► Not available on every architecture
- ► Can combine with counter-mode caching
- Performance:
  - ▶ 5.4 cyles/byte on Power G4 (CTR mode, 16 parallel blocks)
  - ▶ 21.8 cycles/byte on Core 2 (Core microarch, CTR, no parallel blocks)
  - ▶ 11.1 cycles/byte on Core 2 (Penryn microarch, CTR, no parallel blocks)

# AES nowadays

```
pxor %xmm5, %xmm0
aesenc %xmm6, %xmm0
aesenc %xmm7, %xmm0
aesenc %xmm8, %xmm0
aesenc %xmm9, %xmm0
aesenc %xmm10, %xmm0
aesenc %xmm11, %xmm0
aesenc %xmm12, %xmm0
aesenc %xmm13, %xmm0
aesenc %xmm14, %xmm0
aesenc %xmm14, %xmm0
```

- ► AESNI instructions on Intel processors
- Introduced with Westmere microarchitecture
- ► State in %xmm0
- ▶ Round keys in %xmm5 ... %xmm15
- Also instructions for key expansion, decryption
- ► AES instructions take constant time
- ► For parallel modes up to 0.4 cycles/byte (e.g., Raptor Lake)

## **AES** summary

- ▶ Best case: hardware support is available (e.g., AESNI)
- ► If not:
  - ▶ Bitslicing (performance highly depends on micro-architecture)
  - Vector-permute instructions (availability depends on architecture and instruction-set extensions; performance depends on micro-architecture)
  - ► Table-based approach is typically fast but vulnerable to timing attacks (almost everywhere)

## **AES** summary

- Best case: hardware support is available (e.g., AESNI)
- ► If not:
  - ▶ Bitslicing (performance highly depends on micro-architecture)
  - Vector-permute instructions (availability depends on architecture and instruction-set extensions; performance depends on micro-architecture)
  - ► Table-based approach is typically fast but vulnerable to timing attacks (almost everywhere)

## Why was Rijndael chosen as AES?

- Faster than, e.g., SERPENT in software (for table-based implementations)
- From the Report on the Development of the Advanced Encryption Standard (AES), October 2000:

"Table lookup: not vulnerable to timing attacks; relatively easy to effect a defense against power attacks by software balancing of the lookup address."

#### AES on Cortex-A8 with NEON

#### Cortex-A8

- ▶ 32-bit ARMv7 core (2 instructions per cycle with various restrictions)
- ▶ NEON vector coprocessor working on 128-bit vectors
- Present in a large variety of mobile devices, e.g., Apple iPhone 3GS, Apple iPhone 4, 3rd generation Apple iPod touch (late 2009), Apple iPad 1, Nokia N9, Nokia N900, Palm Pre Plus, Samsung/Google Nexus S, Samsung Galaxy S
- ▶ Today very cheap (e.g., Allwinner A10 for  $\approx$  US\$5)

#### AES on Cortex-A8 with NEON

#### Cortex-A8

#### From AES to Salsa20

- ► High-speed AES is typically for streaming modes (e.g., CTR)
- ► Simple reason: larger degree of parallelism
- ► If we don't need chaining modes, can also use stream cipher (should be faster)

#### From AES to Salsa20

- ► High-speed AES is typically for streaming modes (e.g., CTR)
- ► Simple reason: larger degree of parallelism
- ► If we don't need chaining modes, can also use stream cipher (should be faster)
- ► Traditional stream cipher: RC4

- ► High-speed AES is typically for streaming modes (e.g., CTR)
- Simple reason: larger degree of parallelism
- ▶ If we don't need chaining modes, can also use stream cipher (should be faster)
- ► Traditional stream cipher: RC4
  - Broken by Fluhrer, Mantin, and Shamir in 2001

- ► High-speed AES is typically for streaming modes (e.g., CTR)
- Simple reason: larger degree of parallelism
- ▶ If we don't need chaining modes, can also use stream cipher (should be faster)
- ► Traditional stream cipher: RC4
  - Broken by Fluhrer, Mantin, and Shamir in 2001
  - ► More broken by Klein in 2005

- ► High-speed AES is typically for streaming modes (e.g., CTR)
- Simple reason: larger degree of parallelism
- ▶ If we don't need chaining modes, can also use stream cipher (should be faster)
- ► Traditional stream cipher: RC4
  - ▶ Broken by Fluhrer, Mantin, and Shamir in 2001
  - ▶ More broken by Klein in 2005
  - Broken even more by AlFardan, Bernstein, Paterson, Poettering, Schuldt in 2013

- ► High-speed AES is typically for streaming modes (e.g., CTR)
- Simple reason: larger degree of parallelism
- ▶ If we don't need chaining modes, can also use stream cipher (should be faster)
- ► Traditional stream cipher: RC4
  - Broken by Fluhrer, Mantin, and Shamir in 2001
  - ► More broken by Klein in 2005
  - Broken even more by AlFardan, Bernstein, Paterson, Poettering, Schuldt in 2013
  - ... and even more by Garman, Paterson, and van der Merwe in 2015

  - ... and by Bricout, Murphy, Paterson, and van der Merwe in 2016
- Better candidates are in eSTREAM portfolio:
  - Competition to find good stream ciphers organized by ECRYPT
  - ▶ Running from 2004–2008
  - Final decision: 3 ciphers in "hardware" portfolio; 4 in "software" portfolio
  - One cipher in the "software" portfolio: Salsa20 by Bernstein

#### Salsa20

- ▶ Generates random stream in 64-byte blocks, works on 32-bit integers
- ► Blocks are independent
- Per block: 20 rounds; each round doing 16 add-rotate-xor sequences, such as

$$s4 = x0 + x12$$
  
  $x4 ^= (s4 >>> 25)$ 

► These sequences are 4-way parallel

#### Salsa20

- ► Generates random stream in 64-byte blocks, works on 32-bit integers
- ► Blocks are independent
- Per block: 20 rounds; each round doing 16 add-rotate-xor sequences, such as

$$s4 = x0 + x12$$
  
  $x4 = (s4 >>> 25)$ 

- ► These sequences are 4-way parallel
- ▶ In ARM without NEON: 2 instructions, 1 cycle
- ▶ Sounds like total of  $(20 \cdot 16)/64 = 5$  cycles/byte

### Salsa20

- ► Generates random stream in 64-byte blocks, works on 32-bit integers
- ► Blocks are independent
- Per block: 20 rounds; each round doing 16 add-rotate-xor sequences, such as

$$s4 = x0 + x12$$
  
  $x4 ^= (s4 >>> 25)$ 

- ► These sequences are 4-way parallel
- ▶ In ARM without NEON: 2 instructions, 1 cycle
- ▶ Sounds like total of  $(20 \cdot 16)/64 = 5$  cycles/byte, but:
  - Only 14 integer registers (need at least 17)
  - ► Latencies cause big trouble
  - Actual implementations slower than 15 cycles/byte

# A first approach in NEON

▶ Per round do  $4 \times$  something like:

```
4x a0 = diag1 + diag0
4x b0 = a0 << 7
4x a0 unsigned >>= 25
    diag3 ^= b0
    diag3 ^= a0
```

► + some (free) shuffles

# A first approach in NEON

▶ Per round do  $4 \times$  something like:

```
4x a0 = diag1 + diag0
4x b0 = a0 << 7
4x a0 unsigned >>= 25
    diag3 ^= b0
    diag3 ^= a0
```

- ► + some (free) shuffles
- Intuitive cycle lower bound:  $(5 \cdot 4 \cdot 20)/64 = 6.25$  cycles/byte

# A first approach in NEON

▶ Per round do  $4 \times$  something like:

```
4x a0 = diag1 + diag0
4x b0 = a0 << 7
4x a0 unsigned >>= 25
    diag3 ^= b0
    diag3 ^= a0
```

- ► + some (free) shuffles
- Intuitive cycle lower bound:  $(5 \cdot 4 \cdot 20)/64 = 6.25$  cycles/byte
- ▶ Problem: The above sequence has a 9-cycle latency, thus:  $(9 \cdot 4 \cdot 20)/64 = 11.25$  cycles/byte

- ► Salsa20 rounds have 4-way data-level parallelism
- ► In a scalar implementations this turns into 4-way instruction-level parallelism

- ► Salsa20 rounds have 4-way data-level parallelism
- ► In a scalar implementations this turns into 4-way instruction-level parallelism
- ► Good for pipelined and superscalar execution

- ► Salsa20 rounds have 4-way data-level parallelism
- ► In a scalar implementations this turns into 4-way instruction-level parallelism
- ► Good for pipelined and superscalar execution
- ► The vector implementation needs 4-way data parallelism, there is (almost) no instruction-level parallelism left
- ▶ Bad for pipelined and superscalar execution

- ► Salsa20 rounds have 4-way data-level parallelism
- ► In a scalar implementations this turns into 4-way instruction-level parallelism
- ► Good for pipelined and superscalar execution
- ► The vector implementation needs 4-way data parallelism, there is (almost) no instruction-level parallelism left
- ▶ Bad for pipelined and superscalar execution
- ► Idea: Blocks are independent, use this to re-introduce instruction-level parallelism

- ► Salsa20 rounds have 4-way data-level parallelism
- ► In a scalar implementations this turns into 4-way instruction-level parallelism
- Good for pipelined and superscalar execution
- ► The vector implementation needs 4-way data parallelism, there is (almost) no instruction-level parallelism left
- ▶ Bad for pipelined and superscalar execution
- ► Idea: Blocks are independent, use this to re-introduce instruction-level parallelism
- ▶ Lower bound when interleaving 2 blocks: 6.875 cycles/byte
- ▶ Lower bound when interleaving 3 blocks: 6.25 cycles/byte

## Going even further

- ► NEON is basically a coprocessor to the ARM core
- ► ARM decodes instructions, forwards NEON instructions to the NEON unit

### Going even further

- ► NEON is basically a coprocessor to the ARM core
- ARM decodes instructions, forwards NEON instructions to the NEON unit
- ▶ Idea: Also keep the ARM core busy with Salsa20 computations
- ▶ New bottleneck: ARM core decodes at most 2 instructions per cycle

## Going even further

- ► NEON is basically a coprocessor to the ARM core
- ARM decodes instructions, forwards NEON instructions to the NEON unit
- ▶ Idea: Also keep the ARM core busy with Salsa20 computations
- ▶ New bottleneck: ARM core decodes at most 2 instructions per cycle
- ► Add-rotate-xor is only 2 ARM instructions
- Best tradeoff: One block on ARM, two blocks on NEON

#### A flavor of the code

```
4x a0 = diag1 + diag0
    4x next_a0 = next_diag1 + next_diag0
            s4 = x0 + x12
            s9 = x5 + x1
4x \ b0 = a0 << 7
    4x next b0 = next a0 << 7
4x a0 unsigned>= 25
    4x \text{ next a0 unsigned} >= 25
            x4 ^= (s4 >>> 25)
            x9 ^= (s9 >>> 25)
            s8 = x4 + x0
            s13 = x9 + x5
   diag3 ^= b0
       next diag3 ^= next b0
   diag3 ^= a0
       next_diag3 ^= next_a0
            x8 ^= (s8 >>> 23)
            x13 ^= (s13 >>> 23)
```

### Result

 $5.47\ \text{cycles/byte}$  for Salsa20 encryption on ARM Cortex-A8 with NEON
